NON-PCB WITH U.L. RECOGNIZED PROTECTOR

Mallory Non-PCB capacitors contain Metallized Polypropylene Dielectric and a biodegradable fluid for environmental compatibility. They also incorporate a U.L. recognized internal protective device to minimize the hazard of case rupture in the event of capacitor failure. These capacitors are useful in a variety of applications where continuous operation is required on the normal AC Power source available in home and industry.

They offer good reliability and long life and are designed to meet the intent of EIA Standard RS-456 — characteristic "E" or "F."

CAPACITANCE

Nominal capacitance expressed in picofarads (uF) by three-digit number, first two digits represent significant figures, last digit specifies number of zeroes to follow. When the nominal value is less than 10 pF, the letter 'R' indicates the decimal point and the succeeding digit(s) represent significant figure(s). For example: IRO indicates 1.0 pF; R75 indicates 0.75 pF and OR5 indicates 0.5 pF.

Ultra-Q Miniature Microwave Ceramic Capacitors QUALIFIED TO MIL-C-55681B

A state of the art ceramic capacitor designed for use at microwave frequencies. The superior dielectric properties of the ceramic material furnish extremely high Q and lowest loss of any type capacitor available. A minimum Q of 10,000 is guaranteed at 1 MHz. Units are available in either chip form or various leaded configurations. Typical applications include low noise FET circuits, high frequency, low noise receiver front ends and UHF microwave hybrids.

CAPACITANCE

Nominal capacitance expressed in picofarads (pF) by three-digit number, first two digits represent significant figures, last digit specifies number of zeros to follow. When the nominal value is less than 10 pF, the letter 'R' indicates the decimal point and the succeeding digit(s) represent significant figure(s). For example: IRO indicates 1.0 pF; R75 indicates 0.75 pF and OR5 indicates 0.5 pF.

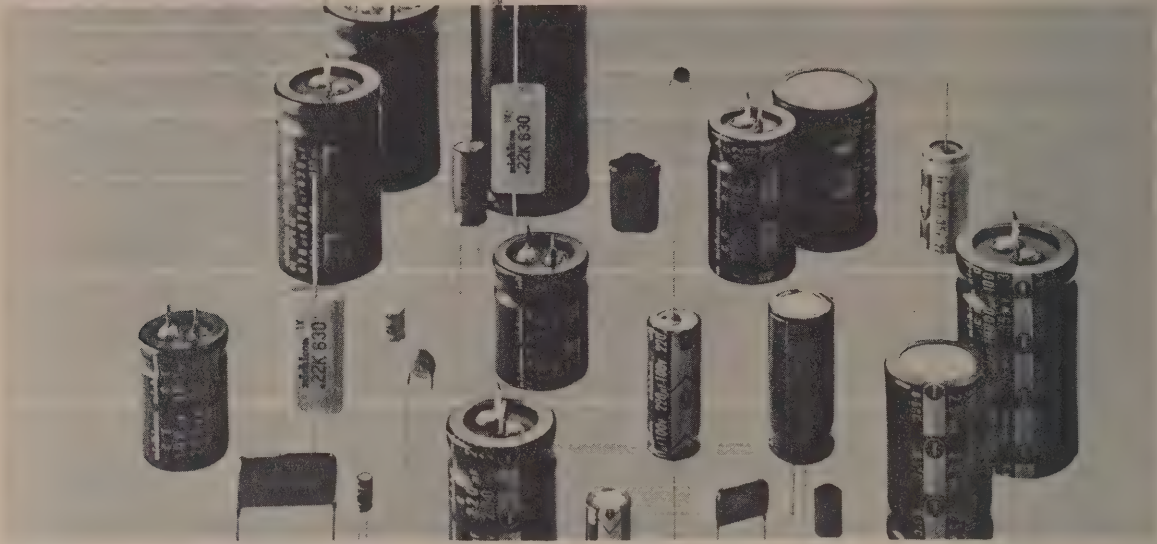
SHORT FORM CATALOG



At Nichicon, we're capacitor specialists. So we have to go to extremes for you. To answer your engineering questions. To help you solve design problems. To match the right capacitor to the application...at the right price, when you need them.

Nichicon is one of the world's largest manufacturers of miniature and can type aluminum electrolytic, semi-conductive ceramic disc, polyester film and metallized polyester film capacitors.

For catalogs and pricing contact your local Nichicon representative or distributor. You can also call or write Nichicon (America) Corporation, 927 E. State Parkway, Schaumburg, Illinois 60195. (312) 843-7500.

We're Nichicon. The capacitor choice.

IMPORTANT INFORMATION IN THE APPLICATION OF ALUMINUM ELECTROLYTIC CAPACITORS

1. DC electrolytic capacitors have polarity. The polarity is marked on the body of the capacitors. This type of capacitor must not be used with polarity reversed.
2. Voltage in excess of the rated voltage and/or the rated surge voltage must not be applied.
3. The capacitors should not be used at temperatures exceeding the range of the specified operating temperature.
4. In general, capacitance values decrease as the frequency increases.
5. If the capacitors are stored or left unused for more than three (3) years at normal storage temperature (−40°C ~ +40°C), aging should be conducted at the rated working voltage before application.
6. Soldering irons should not come in contact with the vinyl insulating sleeves of the capacitors.
7. Dip-soldering of the capacitors should not exceed ten (10) seconds at 260°C.
8. The capacitors may be damaged with some cleaning solvents such as Chlorothine, Triclene, Methyl Chloride, etc.

When requesting more information or data sheets, reference the series type number.

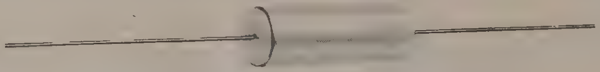
TYPE 107 POLYESTER FILM CAPACITORS

POLYESTER FILM CAPACITORS EXTENDED FOIL/FILM WRAP/EPOXY END FILL STYLE 107 −55°C TO +125°C



ELECTRICAL AND ENVIRONMENTAL CHARACTERISTICS

CAPACITANCE MEASUREMENTS

Capacitors of 1.0 μF or less shall be measured at a frequency of 1000 Hz. Capacitors greater than 1.0 μF shall be measured at 60 Hz. The standard capacitance tolerance is 20%. Other tolerances are available upon request.

Reference: MIL-STD-202, Method 305.

TEMPERATURE CHARACTERISTICS

The maximum change in capacitance from the measured value at +25°C shall be −6% at −55°C, and +15% at +125°C.

DISSIPATION FACTOR

When measured as specified in Paragraph 1, the dissipation factor at +25°C shall not exceed 0.6% for values up to 1.0 μF and shall not exceed 1.0% for greater capacitance values.

INSULATION RESISTANCE

When measured at +25°C, and rated voltage (or 500 VDC, whichever is less), the insulation resistance shall be a minimum of 50,000 megohm-microfarads, but need not exceed 100,000 megohms. The period of electrification shall not exceed two minutes.

Reference: MIL-STD-202, Method 302.

VOLTAGE DERATING

The capacitors may be operated at full rated voltage from −55°C to +85°C, or with linear derating to 50% of rated voltage above +85°C with a maximum temperature of +125°C.

VOLTAGE TEST

When tested at +25°C, the capacitors shall withstand the indicated DC test voltages for a period of one minute:

Terminal to terminal	200% of DC rating
Terminal to case (less than .235 diameter)	200% of DC rating
Terminal to case (greater than .235 diameter)	400% of DC rating or 2,000 VDC, whichever is less

Reference: MIL-STD-202, Method 301.

LIFE TESTING

When tested for 1000 hours at 150% of the appropriate rated voltage for the test temperature, the capacitors shall exhibit no more than one failure in twelve pieces tested. Alternatively, an accelerated +125°C test may be performed at the +85°C voltage rating for a period of 250 hours. A failure is defined as:

a) A capacitance change of more than 10% of its initial value;
b) A dissipation factor greater than that specified in Paragraph 3;
c) An insulation resistance less than 1/3 that specified in Paragraph 4; or
d) A permanent open or short.

VIBRATION

The capacitors will meet or exceed in the vibration requirements of MIL-STD-202, Method 201.

ELECTRICAL AND ENVIRONMENTAL CHARACTERISTICS

CAPACITANCE MEASUREMENTS

Capacitors of 1.0 μF or less shall be measured at a frequency of 1000 Hz.

Capacitors greater than 1.0 μF shall be measured at 60 Hz.

The standard capacitance tolerance is 20%. Other tolerances are available upon request.

Reference: MIL-STD-202. Method 305.

TEMPERATURE CHARACTERISTICS AND STABILITY

When measured over the full operating range, the Temperature Coefficient shall be −120ppm/°C ±30ppm/°C.

There shall be less than 0.1% change per year in capacitance when operated between +20°C and +50°C.

After cycling from −55°C to +75°C, the capacitance shall not vary more than 0.2% from its initial measurement at +25°C.

DISSIPATION FACTOR

When measured as specified in Paragraph 1, the dissipation factor at +25°C shall not exceed 0.1%.

INSULATION RESISTANCE

When measured at +25°C, and rated voltage (or 500 VDC, whichever is less), the insulation resistance shall be a minimum of 200.000 megohm-microfarads, but need not exceed 500,000 megohms. The period of electrification shall not exceed two minutes.

Reference: MIL-STD-202, Method 302.

VOLTAGE DERATING

The capacitors may be operated at full rated voltage from −55°C to +65°C, or with linear derating to 60% of rated voltage above +65°C to the maximum operating temperature of +85°C.

VOLTAGE TEST

When tested at +25°C, the capacitors shall withstand the indicated DC test voltages for a period of one minute:

Terminal to terminal	200% of DC rating
Terminal to case (less than .235 diameter)	200% of DC rating
Terminal to case (greater than .235 diameter)	400% of DC rating or 2.000 VDC, whichever is less

Reference: MIL-STD-202, Method 301.

LIFE TESTING

When tested at 85°C for 250 hours at full 65°C rated voltage, the capacitors shall exhibit no more than one failure in twelve pieces tested. A failure is defined as:

a) A capacitance change of more than 6% of its initial value;
b) A dissipation factor greater than that specified in Paragraph 3;
c) An insulation resistance less than 60% that specified in Paragraph 4; or
d) A permanent open or short.

VIBRATION

The capacitors will meet or exceed the vibration requirements of MIL-STD-202, Method 201.

TYPE 188 POLYESTER CAPACITORS

METALLIZED POLYESTER CAPACITORS TYPE 188 FILM WRAP / EPOXY END FILL −55°C TO +125°C

Type 188 Capacitors features extremely small size, light weight and self clearing metallized construction which virtually eliminates catastrophic failures. Well suited for Voltage Multiplier Circuits in TV power supplies and Electrostatic copiers. Also ideal for Potting or encapsulating in Electronic Sub assemblies, Power supplies, etc.

CAPACITANCE

Measurements shall be made at 1000 cycles per second for capacitance values thru 1. MFD and at 60 cycles per second for values over 1. MFD.

CAPACITANCE TOLERANCE

Standard capacitance tolerance is ±20% (M). Closer tolerances available upon request.

DISSIPATION FACTOR

The dissipation factor shall not exceed 1% when measured at 25°C. Measurements shall be made at 1000 Hz for capacitance values thru 1. MF and at 60 Hz for higher values.

TEST VOLTAGE

Capacitors shall withstand 200% of rated DC voltage for one minute at 25°, with the charging and discharge current limited to a maximum of 1. Ampere.

OPERATING TEMPERATURES

−55°C to +125°C.

LIFE TEST

Capacitors shall withstand a life test of 250 hours at 125°C, with 140% of the 125°C rated DC voltage applied. A resistance of one ohm per volt of applied voltage shall be inserted in series with the capacitor.

VOLTAGE DERATING

These capacitors will operate as full DC voltage ratings at 85°C. For operation at temperatures above 85°C, see Figure 4.

VIBRATION

Capacitors shall withstand a vibration test per Method 204, Test condition B of MIL-STD-202B as modified by MIL-C-27287. After test, the I.R. will be equal to or greater than 1/3 of the initial requirement.

HUMIDITY TEST

These capacitors shall meet the humidity test requirements of MIL-STD-202 Method 103B, test condition B. After testing the I.R. will be equal to or greater than 1/3 of the initial requirement.

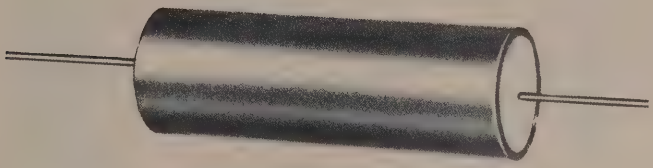
TUBULAR
CAPACITORS**

HIGH VOLTAGE TUBULAR CAPACITORS DUAL DIELECTRIC/OIL IMPREGNATED PHENOLIC CASED/EPOXY END FILL/TYPE 161



RECOMMENDED APPLICATIONS

Nytronics Type 161 Capacitors are well-suited for use in Oscilloscopes, Electronic Air Cleaners, Power Supplies of industrial devices, and related equipment. The design of these capacitors employs a Paper/Polyester Film Section, oil impregnated, incased in a phenolic tube designed specifically for high voltage application. A unique epoxy endfill process precludes oil seepage which occasionally occurs in similar designs.

OPERATING TEMPERATURE

−55°C to +85°C at full rated voltage.

DISSIPATION FACTOR

Will not exceed 1% at 25°C.

MEASUREMENTS

Capacitance up to 1 microfarad are measured at a frequency of 1000 cycles per second and capacitances over 1 microfarad at 60 cps.

DIELECTRIC STRENGTH TEST

Units will withstand a potential of 150% of rated voltage applied for one minute at 25°C.

STANDARD TOLERANCE

±20%. Other tolerances available on request.

STANDARD MARKING

Nytronics, Part No., Capacitance, Voltage, and Date Code.

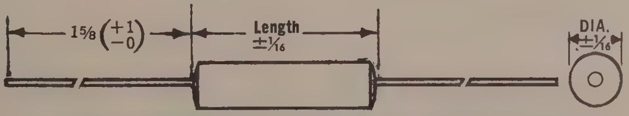
INSULATION RESISTANCE

When measured at the applicable test temperature with an electrification time of two minutes at 500 volts shall be equal to or greater than the values listed below:

Test Temperature	25°C	85°C
Megohms X Microfarads	2000	10
except that the insulation resistance in megohms need not exceed	25000	250

MOISTURE RESISTANCE

These capacitors will meet the moisture resistance requirements of EIA Specification RS-164, which requires units to withstand a 95% Relative Humidity at 40°C, except time of exposure may be increased to 500 hours. After exposure and subsequent drying periods, the insulation resistance will not be less than ⅓ of the initial requirement.



Tinned Copperweld Leads #20 AWG (.032) for sizes to ⅝″ Dia.
#18 AWG (.040) for sizes ⅝″ Dia. and over.

ELECTRICAL AND ENVIRONMENTAL CHARACTERISTICS

1. CAPACITANCE MEASUREMENTS

Capacitors of 1.0 μF or less shall be measured at a frequency of 1000 Hz. Capacitors greater than 1.0 μF measured at 60 Hz.
Tolerances of ±20%, ±10%, ±5%, ±2%, ±1% are standard. Tolerances closer than ±1% are available upon request.
Reference: MIL-STD-202, Method 305.

2. TEMPERATURE/CHARACTERISTICS AND STABILITY

When measured over the full operating range, the Temperature Coefficient shall be −120 ppm/°C ±30 ppm/°C.
There shall be less than 0.1% change per year in capacitance when operated between +20°C and +50°C.
When cycled from −55°C to +75°C, the capacitance shall not vary more than 0.2% from its initial measurement.

3. DISSIPATION FACTOR

When measured as specified in Paragraph 1, the dissipation factor at +25°C shall not exceed 0.1%.

4. INSULATION RESISTANCE

When measured at +25°C, and rated voltage (or 500 VDC, whichever is less), the insulation resistance shall be a minimum of 200,000 megohm-microfarads, but need not exceed 500,000 megohms. The period of electrification shall not exceed two minutes.
Reference: MIL-STD-202, Method 302.

5. VOLTAGE DERATING

The capacitors may be operated at full rated voltage from −55°C to +85°C.

6. VOLTAGE TEST

When tested at +25°C, the capacitors shall withstand the indicated DC test voltages for a period of one minute:

Terminal to terminal	200% of DC rating
Terminal to case	200% of DC rating

Reference: MIL-STD-202, Method 301.

7. LIFE TESTING

When tested at 85°C for 250 hours at 140% of the rated voltage, the capacitors shall exhibit no more than one failure in twelve pieces tested. A failure is defined as:

a) A capacitance change of more than 6% of its initial value;
b) A dissipation factor greater than that specified in Paragraph 3;
c) An insulation resistance less than 60% that specified in Paragraph 4; or
d) A permanent open or short.

8. VIBRATION

The capacitors will meet or exceed the vibration requirements of MIL-STD-202, METHOD 201.

PEC 831 Metallized Polyester Film

General Characteristics

The PEC 831 is manufactured using a unique packaging process which allows the production of a compact body size for a given capacitance. This allows the designer to specify an automatically insertable, axial lead capacitor allowing higher circuit board densities than were previously possible. The general characteristics of the PEC 831 make it an ideal choice for general coupling, decoupling and filtering applications. All PPD capacitors are made in the U.S. and are available taped and reeled for automatic insertion.

PPC 830 Polypropylene Film/Foil

General Characteristics.

The PPC 830 is an axial lead, polypropylene film capacitor that features small size, low price and flame retardant coating. The electrical stability of polypropylene and its characteristic high resistance to moisture allow these units to retain their original capacitance over long periods of time without degradation due to changing environmental conditions. The PPC 830 has the excellent characteristics previously found only in polystyrene capacitors but offers a higher temperature rating and, of course, flame resistance. The low negative TC and very low dissipation factor of the PPC 830 provide for a stable frequency response curve and high Q in resonant and filtering circuit applications. Since the PPC 830 also exhibits high insulation resistance (I.R.) and low dielectric absorption (D.A.), it is a good choice for storage and timing circuit applications. All PPD capacitors are made in the U.S. and are available taped and reeled for automatic insertion.

PPC 831 Metallized Polypropylene Film

General Characteristics

The PPC 831 is an axial lead, metallized polypropylene film capacitor featuring small size, high performance, low price and conformal encapsulation with a flame retardant coating.

The physical and electrical characteristics of polypropylene as a dielectric are commendable. Polypropylene is relatively impervious to moisture. It is also extremely stable. The PPC 831 will, therefore, retain its original properties over extended periods of time in a fluctuating environment.

Other noteworthy attributes of the PPC 831 are high insulation resistance (IR) and a low dielectric absorption (DA) factor. Both of these parameters are of critical importance in the selection of a sample-and-hold capacitor in data acquisition applications. The DA of polypropylene is about 10 times less than that of polyester and is significantly less than that of polycarbonate or polystyrene.

Also to be considered are the gently sloping curves for temperature coefficient (TC), dissipation factor (DF) and capacitance variation with frequency. The relatively flat response of the PPC 831 assures dependable, stable performance when incorporated into critical resonant and filtering circuit applications.

The "A" and "B" case sizes of the PPC 831 and PEC 831 style capacitors are computer designed with today's manufacturing and design criteria firmly in mind — namely, automation.

Until now, the most useful configuration for automated assembly, with respect to general bypassing, filtering and timing requirements, has been the box style capacitor. This is because the corresponding axial style devices are of physical proportions incompatible with automatic insertion equipment. Unfortunately, the box capacitor presents the modern factory with its own unique problems. An expensive radial insertion machine must be obtained. Box insertion requires an additional step in the assembly process which adds both direct and indirect production costs. In comparison, axials insert 3 times faster than radials.

PPD has been studying this situation for some time now. The culmination of this work has been the development of the "A" and "B" case film capacitors. The designer is now presented with the capability of specifying axial lead, automatically insertable, metallized film capacitors in the range of .001 μF to .27 μF. Examination of the dimensions of the "A" and "B" cases will reveal that, in length, they closely approximate the dimensions of RN55 and RN60 style resistors. Both "A" and "B" cases have a .177" ± .020" diameter. They can, therefore, be taped on 0.2" centers. Ultimately, these devices can be sequenced on standard axial lead insertion machinery to provide high volume, low cost production.

PRINTED FILTER

- The use of mica as dielectric material for the substrate assures high temperature stability, stable cut off frequency and low ripple within pass band.
- This unit with a thin configuration is more suitable for conservation of space comparing with hybrids and discrete parts.
- A small number of external connections assures high reliability of connections and contributes a decrease in cost.

HIGH-REL • HIGH-Q • HIGH-VOLTAGE CERAMIC CHIP CAPACITORS

It's official. We've changed our name from Statnetics to Microcap and are expanding our manufacturing operation. But our customers know that what won't change is the quality and depth of service they've come to depend on. Or the fast delivery we're famous for.

Microcap is now the premier name in high reliability MLC chip capacitors — perfect for hybrid circuitry or wherever surface mounted components are required. Microcap produces high-voltage, high-Q, and standard MLC chip capacitors in both Class I dielectrics (NPO) and Class II dielectrics (X7R, BX). What's more, Microcap provides components certified under performance tests outlined by MIL-C-55681, high reliability Group A, B, and C inspection.

CERAMIC CAPACITORS

MULTILAYER CERAMIC CAPACITORS

DK multilayer ceramic capacitors are supplied five basic styles to fit any application. Each f the styles is available in a wide range of alues ranging from as low as 0.5 pF to as high s 4.7 μF. Several choices of temperature coefficients are available in all styles to match the apacitors to the circuit needs. Tolerances are etailed in the table below.

number of styles are particularly suited to utomatic insertion and assembly techniques. he C3216 and C2012 (chips) series are available on tape and reel as well as in magazines for se in hybrid circuits or direct mounting to P/C oards. One style of dipped capacitors (FK20 & K22) is especially designed for automatic insertion. All of the axial styles (MA12, MA13 & A14) are available taped and on reels.

here are special types for use in high frequency up to 1 GHz) in three styles as shown at the ottom of this page.

or complete details on TDK capacitors, ask for atalog BMCE.

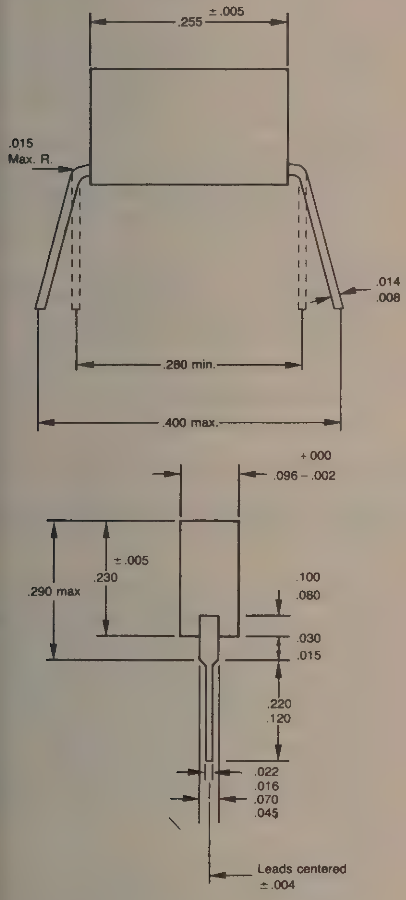
Metallized Polyester DIP

TRW

Type TRW-81

- **High IR**
- **Low DF**
- **Self-Healing**
- **Low ESR**
- **Flame Retardant Molded Epoxy Case**
- **2-pin DIP Leads**



The TRW-80 series embodies the latest in thin gauge technology. The use of ultra-thin gauge metallized polyester packaged in a small molded case with short 2 pin-dip leads provides near-ideal performance. The reliability of self-healing gives long catastrophic failure-free operation while the small package affords the low-inductance and low ESR so vital in future designs. The consistant size, low weight, precise lead placement and radial lead packaging make the TRW-80 series ideal for low cost high speed manufacturing.

SPECIFICATIONS

Insulation Resistance: Measured after 60 seconds at 25°C and rated voltage. See Table below.

Dissipation Factor: Shall be less than 1.0% when measured at 1000 ±20 Hz and at 25°C for values up to and including .12 MFD.

Metallized Polypropylene Dielectric

Type TRW-35

- **Designed for switching power supply applications**
- **Rated for 20 KHz usage**
- **High current — up to 9A rms**
- **Capacitance to 30 mfd**
- **Special high current termination**
- **Very low ESR values**

PERFORMANCE

The TRW-35 is designed specifically for switching power supply applications where high current, high capacitance range and low ESR values are important.

The Metallized polypropylene TRW-35 shows negligible shift in capacitance under long term exposure to humidity, operating life and temperature cycling. Insulation resistance, dielectric absorption and dissipation factor properties are all superior to those of electrolytic capacitors presently used by switching power supply manufacturers. Added to these features are size and weight savings.

APPLICATIONS

The TRW-35 is used for input filtering, hi-frequency transformer D.C. blocking, and output filtering. As an input filter it provides EMI protection back into the line (generated by the switch) and serves as a quasi-constant current source (turn on for the switch). As a D.C. blocking capacitor it prevents D.C. saturation of the hi-frequency transformer caused by switch unbalance while passing the AC square wave with little loss. As an output filter it provides a low impedance path for high frequency ripple filtering.

Unlike the electrolytic capacitor often used for such applications, the TRW-35 exhibits little or no capacitance roll-off with increasing frequency. The TRW-35 features ESR typically an order of magnitude or more under the ESR of equivalent electrolytic capacitance values.

In filter designs where capacitance values of 30 mfd or smaller are adequate for system performance, the TRW-35 offers impedance characteristics that can significantly enhance the overall system design.

SPECIFICATIONS

Dissipation Factor: Shall be less than 0.1% when measured at or referred to 1000 Hz ±20 Hz. Typical value is 0.05%.

Capacitance: Shall be within specified tolerance when measured at or referred to 1000 Hz ±20 Hz.

Insulation Resistance: Shall be greater than 100,000 megohms — Micro Farads but need not exceed 500,000 megohms when tested at 25°C and electrified at 100 VDC for 2 minutes.

ESR: The 100 KHz ESR values shall not exceed the values shown.

Construction: Non-inductive winding, polypropylene dielectric, metallized electrodes with special high current termination.

Case: Polyester tape wrap with epoxy endseals.

Lead Material: Tinned copper wire.

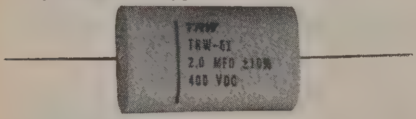
Temperature Rating: 55°C to 105°C with no voltage derating.

Voltage: 100 thru 400 VDC.

Metallized Polyester

Type TRW-61

- **Rated for 60 KHz usage**
- **High current — up to 4A rms**
- **Capacitance to 4.7 mfd**
- **White polyester tape wrap case**
- **Special high current termination**
- **Low ESR values**



PERFORMANCE

The TRW-61 is designed specifically for switching power supply applications where current and low ESR Values are important. The metallized polyester TRW-61 shows negligible shift in capacitance under long exposure to humidity, operating life and temperature cycling. Insulation resistance, dielectric absorption and dissipation factor properties are all superior to those of electrolytic capacitors presently used by switching power supply manufacturers.

These features, plus size and weight savings in SPS designs, make the TRW-61 the logical capacitor for performance and design of switching power supplies requiring medium current ratings.

RC Snubber Network

Type TRW-39A

- **Resistor: 3.9 ohm ½ watt ±10% carbon composition**
- **Capacitor: 0.1 mfd ±20%, 50 VDC**
- **White polyester tape wrap case**
- **Low inductance, extended foil construction**
- **Rugged polyester-foil design**
- **RC = 0.39 micro second nominal**

PERFORMANCE

This rugged RC network is designed for snubber applications across Schottky diodes operating in 20 KHz switching power supplies and provides critical damping of the ringing encountered in many circuits.

APPLICATIONS

Specifically designed for applications in 20 KHz switching power supplies, the TRW-39A provides critical damping and reverse voltage protection for the Schottky diode. The leakage inductance of the high frequency power transformer causes ringing of the reverse voltage when diode conduction abruptly ceases. This can cause Schottky diode failure. Figure 1 shows the snubber used across each diode. For other RC values contact TRW Capacitors, Application Engineering.

TUSONIX SLC™*

Ceramic Capacitors—Disc

Applications and Features

TUSONIX Ceramic Disc Capacitors offer high performance in a complete range of ratings, values, and sizes. The complete line of voltage ratings offers the designer the convenience of selecting the exact capacitor rating required for his application. TUSONIX Discs are available in 100-200-500 VDC; 1-2-3-4-5 and 6 KV. Capacity increases per size for voltages less than 500 volts and decreases per size for voltages greater than 500 volts. Where voltage rating is not critical, we recommend our standard 500 volt line. (For complete details, consult our Ceramic Disc Capacitor catalog.)

Ceramic Capacitors—WEECON® Plate

Applications and Features

TUSONIX WEECON Plate Ceramic Capacitors offer the broadest selection of ceramic formulations and package sizes available. Capacitance values range from 1 pF through .082 uF; a variety of TC materials and tolerances is available. The range of temperature characteristics adapts these capacitors from the ultra stable requirements of tuned circuits to the general purpose needs for coupling and by-pass applications. Voltages are from 25V to 500V. (For complete details, consult our WEECON® Ceramic Capacitor catalog.)

Physical Characteristics

Weecon **Temperature Compensating** Ceramic Capacitors are ideal for applications demanding precisely controlled capacitance changes with temperature variation. They are well suited for high Q circuits requiring optimum frequency stability and have excellent retrace characteristics. **Extended Temperature Compensating** Weecons are indicated where large controlled capacitance change with temperature variation is a factor. For applications where volumetric efficiency is of prime importance, **Stable** Weecons will provide higher capacitance values, in smaller packages with better reliability. TUSONIX **General Purpose** Weecons are ideal for circuits requiring the utmost in volumetric efficiency at rated temperatures.

RECOMMENDED SOLDERING PROCEDURES FOR INSTALLING DISCOIDAL CAPACITORS.

To insure that the reliability of the part is not destroyed by improper installation, adhere to the following procedure:

1. the part must not be over stressed thermally or mechanically during installation;
2. preheat the part and chassis to 250/275° F and complete the solder joint with a small iron (50 watts). Use 60% tin, 40% lead solder.
3. limit soldering temperature to 500°F;
4. chassis with part mounted should be cooled at a rate similar to that of the pre-heat operation.
5. oven soldering and induction soldering are not recommended

SPECIFICATIONS

DIELECTRIC WITHSTANDING VOLTAGE

200% of rated voltage applied through a minimum limiting resistance of 100 Ohms/Volt. Duration of voltage stress shall be 15 seconds minimum and 1 minute maximum at 25°C.

TEMPERATURE RANGE

−55°C to +85°C with full rated voltage applied. To +125°C with 50% of rated voltage.

INSULATION RESISTANCE

At 25°C after 2 minutes of electrification at rated voltage or 500 VDC, whichever is less, the minimum product of Insulation Resistance and Capacitance shall be 100,000 megohms-microfarads, but need not exceed 100,000 megohms.

DISSIPATION FACTOR

Shall not exceed 0.75% when measured at 25°C and 1000 Hz, ±20 Hz. See characteristic curves for D.F. ratings at other temperatures.

LIFE TEST

Shall withstand 140% of rated voltage at 85°C for 250 hours. One failure in twelve shall be permitted.

CAPACITANCE STABILITY (DRIFT)

Less than 0.50% when measured in the following manner: three capacitance readings at 25°C, each made prior to and after temperature cycling from room to 80°C, and room to −55°C. The mathematical difference between the two extremes, divided by the intermediate value, and then multiplied by 100, yields the stability expressed in percent.

HUMIDITY RESISTANCE

Meets requirements of Mil-C-27287,, Para. 3.12 when tested in accordance with Mil-STD.-202C, Method 103 B, Condition B.

LEAD PULL AND BEND TEST

TEMPERATURE RANGE

−55°C to +85°C with full rated voltage applied. To +125°C with 50% of rated voltage.

INSULATION RESISTANCE

At 25°C after 2 minutes of electrification at rated voltage or 500 VDC, whichever is less, the minimum product of Insulation Resistance and Capacitance shall be 30,000 megohms-microfarads, but need not exceed 30,000 megohms.

DISSIPATION FACTOR

Shall not exceed 1.0% when measured at 25°C and 1000 Hz, ±20 Hz. See characteristic curves for D.F. ratings at other temperatures.

CAPACITANCE AND TOLERANCE

Shall be measured within the tolerance limits specified. Measurements will be made at 25°C and 1000 Hz, ±20 Hz.

LIFE TEST

Shall withstand 140% of rated voltage at 85°C for 250 hours. One failure in twelve shall be permitted.

CAPACITANCE STABILITY (DRIFT)

Less than 0.3% when measured in the following manner: three capacitance readings at 25°C, each made prior to and after temperature cycling from room to 85°C, and room to −55°C. The mathematical difference between the two extremes, divided by the intermediate value, and then multiplied by 100, yields the stability expressed in percent.

HUMIDITY RESISTANCE

GET ORGANIZED!

Are your catalog files organized? Can you find any given catalog in a matter of seconds? If your answer is "Yes," you probably already have the EEM File System. But, if you said "No," you really ought to look into this simple system. It will save hours of time and tons of aggravation.

The EEM File System was invented over twenty-five years ago to help people who specify, buy, or work with electronic products and equipment. It is upgraded on a constant basis to reflect the current state of the art. It's easy to use and easy to customize to your particular needs.

You say you want to file catalogs by type of product? That's easy to do with The System. But, what are you going to do when there are multiple products in one catalog? Take Mallory for example. There are all kinds of products in the Mallory Short Form Catalog. With the EEM File System all you do is file the catalog under "M" for Mallory and refer to it on all of the cross reference cards that apply.

There are thousands of EEM File Systems in everyday use in engineering and procurement offices all over the world. Shouldn't you be using this proven system?

The EEM File System is shipped in one neat package. The package contains everything you need to set up your very own filing system. Best of all, it's easy to get and very affordable. Send a check or money order for $25.00 and EEM will pay the postage and sales tax. If you must use a purchase order, please add $5.00 for postage and handling. An invoice will accompany your System.

Don't waste any more time. Get organized now!

SUB-MINIATURE RF CHOKES

An extremely versatile series of iron core R.F. chokes designed to meet the industries' demand for high reliability, ultra-miniature components. The coils are ideally suited to network and filter design, delay lines and computer applications. The coils are impregnated with a moisture resistant lacquer and on special order they can be fungus-proofed per JAN-T-152 using varnish per MIL-V-173A. They can also be encapsulated in epoxy resin to conform to Grade 1, Class B of MIL-C-15305. Note: L measured on 260A Q Meter except 120 thru 500 mH which are measured on 1 kHz Bridge.

ADJUSTABLE R.F. COILS 9100 SERIES SHIELDED

These ultra compact adjustable coils offer a good inductance range with relatively small changes in Q. Tuning is accessible from either top or bottom of the assembly. Magnetic shielding is achieved by the use of cup cores while the copper shield offers effective electro static shielding. Printed circuit terminals on base and shield.

Applications between 10 kHz and 200 MHz
Dimensions: .440″ Sq. x .550″ High.

ECONOMY ADJUSTABLE R.F. CHOKES

Through the use of a recently developed Nylon molding process we are able to offer an inexpensive line of adjustable chokes. These items feature a wide inductance range which has been achieved through the use of a threaded ferrite core. They can be adjusted from either the top or bottom. This lends a degree of flexibility to your design. Mounting is achieved by means of a metal clip in a 5/16″ round hole or a special keyed hole. Instructions supplied with each coil.

SHIELDED SUBMINIATURE ADJUSTABLE RF COILS

Dimensions: ½″ sq., x ⅝″ high.

These compact adjustable coils offer a minimum two-to-one inductance range with relatively small changes in Q. The tuning adjustment is accessible from either the top or bottom of the coil assembly. Magnetic shielding is achieved through the use of cup cores while the metal shield offers effective electrostatic shielding. Printed circuit terminals on base and shield.

DUAL LINE FILTER CHOKES

Miller Dual Duo-Lateral Line Filter Chokes are wound with two coils on one form, giving the advantage of small physical size in cases where space requirements are stringent and two single coils would occupy too much area. Identical in specifications, except for dimensions, to our single type Duo-Lateral chokes. They are wound on white ceramic forms 2″ in diameter by 4½″ long.

CONFORMAL COATED CHOKES

Coilcraft's axial chokes are **close tolerance** coils totally encapsulated in a durable epoxy coating. Their low cost compared to molded type chokes makes them particularly attractive to high volume users. In addition to the standard values shown, custom chokes are available to meet your specific requirements.

- No molding stress to break wire.
- Closer tolerance on inductance.
- Resistance to humidity equal to or greater than that of molded types.
- Low temperature coefficient, compatible with N030-N080 capacitors.
- Available bulk packed, in conventional tape and reel, or "ammo packs."

TUNEABLE RF COILS

These Coilcraft variable inductors are precision molded in plastic to assure constant winding pitch and a consistent relationship to the printed circuit board. They're ideal for applications requiring low inductance and are more economical than any similar coil. Typical applications include RF coils, IF coils, oscillators, chokes, and helical resonators.

- Reliable one-piece construction
- Compact 10mm or 7mm size
- Molded-in windings assure tight tolerances
- Highly resistant to humidity, temperature, shock and vibration
- Threaded cores allow precise tuning
- Custom values available

ALL INDUCTORS ARE MEASURED AT 0 DC. THE MAXIMUM DC LISTINGS ARE FOR APPROXIMATELY 30°C HEAT RISE AND APPROXIMATELY 2% DROP IN INDUCTANCE. THE CHANGE OF INDUCTANCE WITH AC OR DC CURRENTS IS ILLUSTRATED BY THE CURVES. THE EXCITATION IS PLOTTED IN mA $\times\sqrt{\text{mHy}}$. FOR EXAMPLE THE 0.495 mH INDUCTOR (62272) WITH 170 mA DC FLOWING WILL HAVE AN EXCITATION OF mA $\times\sqrt{\text{mHy}}$ = 120, AND THE INDUCTANCE WILL DROP FROM 495 uH to 485 uH. IF THE 170 mA WAS AC, THE INDUCTANCE WOULD BE 510 uH.

FOR EXAMPLE THE 10 mH INDUCTOR (64314) WITH 79 mA DC FLOWING WILL HAVE AN EXCITATION OF mA X $\sqrt{mH}$ = 79 X $\sqrt{10}$ = 250 AND THE INDUCTANCE WILL DROP FROM 10 mH TO 9mH. PICO's EMI Common Mode Suppression Inductors

- **Minimum possible size**
- **130°C operation (Ambient + Temp. Rise)**
- **Windings Balance ± 1%**
- **Dielectric Strength . . . . 1500 Volts RMS**
- **All units are magnetically shielded**

These Inductors are well suited for use in Switching Regulators, DC to DC Power Supplies and all types of Electrical Equipment where the elimination of line transmitted Electromagnetic Interference is important. Electrical equipment will generate noise due to switching operations of transistors, SCR's, relays, triacs, etc. By using these Inductors, noise being fed back to the power line is minimized to an acceptable level and this noise will not interfere with other equipment operating on the same power line.

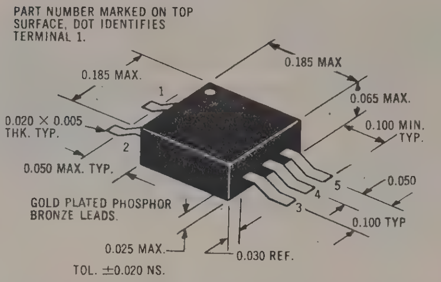
SUB-MINIATURE R.F. WIDEBAND TRANSFORMERS



Transfer-molded as tiny as 0.185 ins. square and 0.065 ins. high, these transformers operate in the frequency range from 500 KHz to 500 MHz. Insertion loss is typically 0.5 dB. Power rating is 100 milliwatts.

The series features DC isolated or non-isolated primary and secondary windings, at impedances from 50 Ohms to 800 Ohms. The secondary winding is either balanced (center-tapped), or unbalanced (no tap).

Designed to exceed the most stringent military and space requirements specified in MIL-T-55631, these transformers will operate over the temperature range −55°C to +125°C. (Maximum temperature rise: +35°C @ +90°C ambient.) Flat gold plated terminations are suitable for gold bonding in hybrid enclosures and for conventional P.C. mounting. The transfer-molded construction meets shock, moisture and vibration tests specified in MIL-T-55631.

Vanguard will also make custom designs to suit your specific frequency ranges, impedance levels and insertion loss requirements.

- All Welded Construction
- Transfer Molded
- Moisture Resistant
- Operating Temperature Range −55°C to +125°C
- Compatible with Reflow Soldering Techniques
- Suitable for Automatic Chip Insertion Equipment

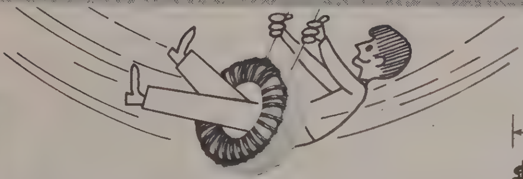
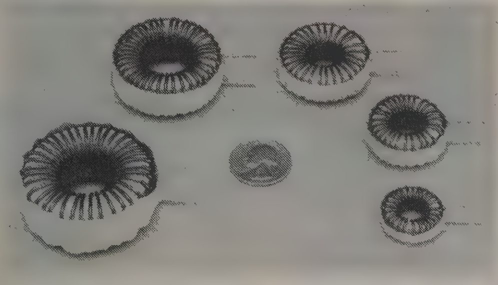
Swingductors™ RL1386





Designed for applications requiring a known inductance change with changing current loads (as in power supplies). Although similar in appearance to conventional toroids, the special core material allows a "controlled saturation," so that a specific inductance value is repeatable at a specific current. The core material is effective up to 1 MHz. As a result of toroidal design, the Swingductor™ produces a closed magnetic field, resulting in low EMI. All are supplied with pretinned leads for easy PC board installation.

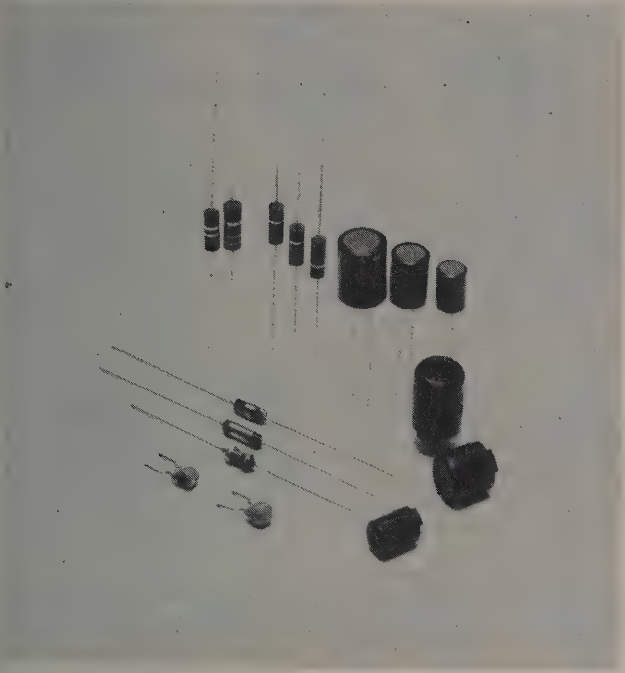
INDUCTORS

FIXED INDUCTORS



Fixed inductors have a wide range of applications such as VCRs, color TVs, stereo car radios, radio transceivers, and industrial electronic products. They are also used in the power-driven tools for EMI filters.

Features

1) EL type
The radial lead type inductor is commonly found in consumer products where most of the EL inductors are used. TDK's original structure and Automated mass-production lines ensures the reliability of these products. EL0405 is available on tape for automatic insertion.

2) SP type
The axial lead type inductor is commonly found in consumer products. SP0408, 0410 and 0412 have the smallest distributed capacity. They are designed for automatic insertion.

3) TP type
This type has high reliability and stability characteristics based on transfer molding and strict quality control. TP0206 type is especially small for application in high density PCBs for measuring instruments and control devices.

4) FS type
This small ferrite shield inductor has a high performance ferrite cap shape with a molded inductor. FS0810 and FS1012 are most suitable for magnetic shield applications.

5) TPF0410 type
This high reliability inductor complies with Defense Agency standards (MIL) and for industrial applications requiring a magnetic shield.

6) NL, NLF type
The electrodes are metal terminals and the inductor has resin coating for heat resistance.

NL, NLF type

1) Metal frame terminal suitable for flow or reflow soldering.
2) Dimensional accuracy is high so the inductors are well suited to automatic PC board mounting machine.
3) High terminal strength gives resistance to pulling and bending after mounting on PCB.
4) Extremely durable against mechanical impact and pressure or shock due to dropping.
5) Extremely stable against temperature and moisture.

Designed to meet the requirements of MIL-C-15305, Grade 1, Class B (−55°C to +125°C). The rated temperature rise is 35°C above an ambient of 90°C. Overload current should not exceed 1.4 times the rated current. Dielectric withstanding voltage is 700 volts rms. The powdered iron cores used in these items possess excellent temperature stability and result in an inductor with low external magnetic field. This allows mounting in close proximity to each other and to other circuit components without ill effects.

The TG and TH series offer high "Q" inductors in a TO-5 transistor can configuration. High density packaging can be accomplished with little regard to coupling between adjacent circuitry since construction of these units results in a low external magnetic and electrostatic field.

TH SERIES

Recommended Frequency Range: 100 KHz to 10 MHz.

Inductance Tolerances: 10 uH through 33 uH, ±10%, 39 uH through 130 uH, ±5%, greater than and including 150 uH, ±3%.

Inductance Stability: Less than or equal to ±2% from −20°C to +85°C.

Method of Test: Inductance and "Q" are measured on HP4342A "Q" meter with leads connected directly to the "Q" meter terminals.

Selection Guide for TRW High Q Coils and Chokes

HIGH Q

Over 40 years of specialization in High Q Inductors are reflected in the superior Q and temperature stability of the molybdenum permalloy dust toroid, ferrites, and laminated structures produced by TRW Inductive Products today. Range of application is from DC to 30 MHz.

This catalog lists many different types of stock inductors, but special custom designs produced to customers' specifications are available on special order. Characteristics such as taps, additional windings, special adjustments such as in a resonant circuit, higher voltage capability, inductance adjusted with DC, special mechanical configurations, and even better temperature stability than our stock items are available to customers' requirements.

WHILE THE TOROIDAL COIL is superior for frequencies above 1 kHz, the laminated structure is superior for lower frequencies. The ML, MO, and MQM uses a hum-reducing lamination structure and, in addition, the ML, and MQM are in hipermalloy shield cases.

The toroidal coils MS, MP, MM, MH, MW, FE, MQE have extremely low hum pickup due to the symmetrical winding on the toroidal core.

ALL STOCK INDUCTORS are measured at 0 DC. The maximum DC listings are for approximately 5% drop in inductance, and negligible heat rise. The typical curves of inductance variation with AC or DC currents, illustrated on the following pages, best show the range of operation for a particular inductor. The excitation is plotted in milliamperes × $\sqrt{\text{mHy}}$. For example, the 100 mHy MS toroid (MS-100) with 10 ma of DC flowing has an excitation factor of 10 ma × $\sqrt{100\text{ mHy}}$ = 100, and the curve shows that approximately 90 mHy will be measured with 10 ma DC.

Since these high Q coils will saturate before any appreciable temperature rises occur, heating is usually not a problem. A general rule would be that four times the DC listings may be applied without any detrimental heating due to copper loss.

FOR VARIABLE INDUCTORS such as HVC, TVC and VIC, the DC values listed apply at the mean to minimum inductance settings only. The maximum inductance cannot be obtained with that amount of DC current flowing.

Temperature stability of all TRW inductors is excellent. Guaranteed limits and typical curves of inductance variation with temperature are shown for most types.

Engineering, laboratory, and production facilities are available for full engineering discussion, sampling, and large quantity production to meet special requirements.

Intermediate inductance values in an existing stock toroidal series are available, priced as the next higher inductance unit.

Power Inductors Switching Regulator Type

TRW POWER

SR Series

PACKAGING Hermetically sealed, molded case.

MIL SPECS To complete MIL-T-27D specs. Type number TF5S04ZZ.

APPLICATION These inductors have low losses in the 3 to 100 kHz frequency range, making them ideal for switching regulator and AC filter choke applications.

INDUCTANCE Type numbers correspond to inductance values in microhenries, which are measured at 1 V, 10 kHz, 0 DC with an inductance tolerance of +15%, −5%. Values of inductance other than listed in an existing size are available. Part Number would be: SR(A, B or C) — (inductance in microhy at 0 DC).

CURRENT RATINGS Listing I_1 is for approximately 10% drop in inductance with a typical 20°C temperature rise, and Listing I_2 is for approximately 20% drop in inductance with a typical 40°C temperature rise.

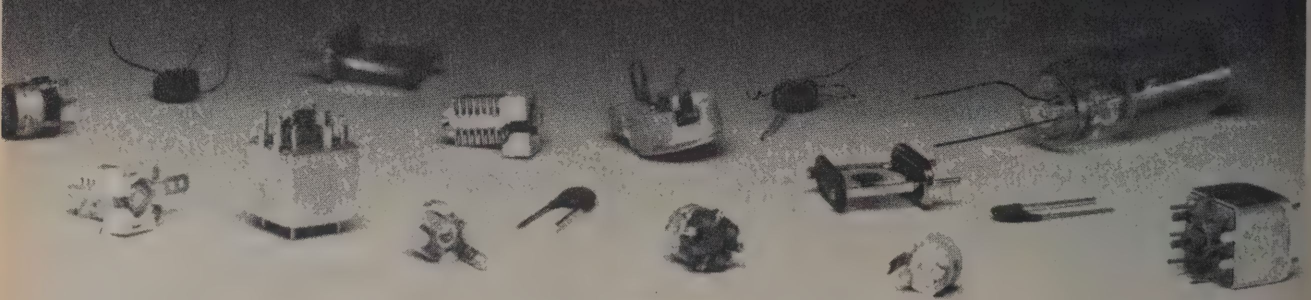
All choke coils in this series are the same size as the unit illustrated. Leads are of No. 20 tinned wire. Tolerances are ± 20% for W10G through W22G: ± 10% from W27G through W101. All units are impregnated with thermosetting varnish and are EIA color coded.

Our more popular, cataloged stock units are available in quantity for immediate delivery.

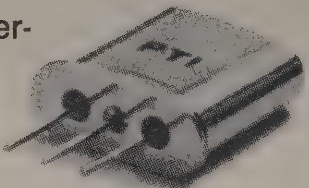
We gave up a lot to improve crystal filter reliability, size and cost.



A lot of components and interconnections, that is. The basic PTI monolithic filter consists of two electrode pairs deposited on the faces of a quartz wafer to form a two-resonator structure. Acoustical coupling between electrode pairs creates a two-pole response.

Simply by designing two-pole filters in cascade, using modern network theory, we can develop four to ten-pole tandem monolithic crystal filters offering maximum reliability, economy, mode suppression, attenuation and minimum size.

There's nothing else. It's that simple. Piezo Technology is the USA's leading supplier of monolithic and tandem monolithic filters, designed specifically for use in communications equipment requiring filtering from 5 to 300 MHz.



Choose from over 100 standard models from 10.7 to 200 MHz in a wide range of miniature, ultraminiature, upright, flat-pack and tandem configurations. Custom designs from below 5 MHz to 300 MHz are available with guaranteed IM, phase noise, linear phase or controlled group delay specifications.

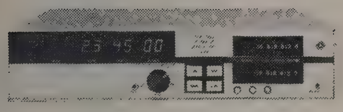
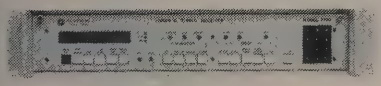
Time/frequency instruments



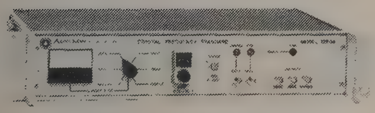
AUSTRON 8154

The Austron Time Code Instrumentation — a complete line of instruments from basic generators and readers to full complement tape search and control units. Available for bench, panel, rack, or portable; all standard IRIG, XR3, and NASA codes are available to give these instruments the flexibility to meet any system requirement.



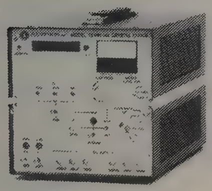
AUSTRON 2100

The Austron Loran-C receivers are microprocessor based automatic acquisition and tracking receivers that utilize the Loran-C groundwave to provide a traceable reference for time epoch determination, frequency management, calibration, and control. These receivers provide time accuracy to one microsecond and frequency accuracy to parts in 10^{-12}.



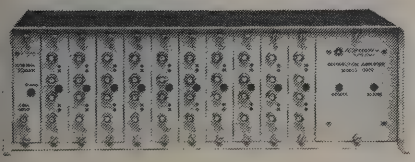
AUSTRON 1250A

The Austron Model 1250A Crystal Frequency Standard generates highly stable output frequencies at 5 MHz, 1 MHz, and 100 kHz. Each of these outputs has excellent waveform and spectral purity. Containing its own internal battery back-up, it also may be used with an external standby power supply such as the Austron Model 1290A Standby Power Supply.



AUSTRON 1210D

The Austron Model 1210D series of Portable Crystal Clocks are compact, self-contained, self-powered time references providing stable time outputs at several pulse and sinusoidal frequencies, as well as a digital time-of-day display.



AUSTRON 1295C

The Austron Model 1295C Distribution Amplifier provides the necessary noise immunity and drive capability to interface a localized frequency standard to other equipment at distances up to 1,000 feet. Four standard frequencies, 10 MHz, 5 MHz, 1 MHz and 0.1 MHz can be accommodated (for other frequencies consult factory). Input frequencies and number of outputs for each frequency are customer specified to provide a more cost effective system. Single frequency units can have up to 40 individual outputs, while units with 2 to 4 frequency inputs will have four or more outputs for each input.

SYSTEMS—complete systems for generation, management, and distribution of precise time and frequency. Austron's engineering has led to such sophistication as the secure communications frequency control sets AN/GSQ-174 and AN/GSQ-183. Time and Frequency Receivers, Disciplined Frequency Standards, Distribution Amplifiers, Time Code Generators and Readers, and all ancillary equipment along with Austron Engineering . . . put it to work, for you!

General Purpose and Mil-Spec.

Good performance and reliability plus versatility in mounting and economy pinpoint this group as the logical choice for most computer, data processing and general purpose applications. A variety of holder styles is available with the familiar Mil-Spec solder seal or our "Resistance-Weld" seal, a newer process ideally adapted to volume production at lowest cost with a reduced possibility of contamination.

TECHNOLOGY " + " FILTERS
The Extra Edge in Systems Performance DC to 1 GHz

Comstron has developed optimum frequency or time domain filters to produce near theoretical system performance. These technology + filters are available as catalog items or custom tailored to your needs.

Design

Comstron has implemented modern network synthesis and physical realization techniques to the point where highly reliable, compact, LC and crystal filters are available – quickly and economically. Proprietary computer analysis, modeling, and optimization programs efficiently arrive at near-optium solutions to spectral, time domain, and stochastic problems. The Company's Enhanced Synthesis Program (ESP), Filter Optimization Program (FOP) and Parameter Optimization Program (POP) provide design parameters for systems oriented functions. Requirements for group delay equalization, wide band arithmetic symmetry, x/sin x amplitude correction, corrected Nyquist filters, phase compensation, and time domain response designs are routinely and efficiently handled.

Test

The Company's commitment to excellence is evident in its extensive test facilities. Automatic computer based network analyzers cover the frequency range from dc to 1.3 GHz with full plotting and printer output capability. Parameters which are automatically measured include amplitude response, phase response, group delay, and return loss. Time domain testing can also be performed to verify impulse response or response to complex waveforms.

Computer directed environmental testing allows unattended measurements of performance over temperature on a production basis. Comstron's proprietary Automatic Filter Test (AFT) programs permits rapid and accurate generation of acceptance test procedures as well as full documentation and data files when required.

Quality Control

Comstron maintains a Quality Control Department that ensures compliance with MIL-I-45208A and MIL-Q-9858A when applicable. Microscopic inspection, controlled environment, material control and traceability, solder training programs, and strict configuration management all contribute to producing an exceptionally reliable product.

The quality control program is continuously monitored. Over the years since its inception, Comstron has assembled a dedicated, conscientious staff whose pride of workmanship and customer loyalty is the keynote of the Company.

Miniature High Performance LC Filters 1-1000 MHz

Comstron's FA-3800 Series Miniature High Performance Filters are optimized for use in the 1 to 1000 MHz frequency range. Although they are considerably smaller than comparable tubular filters their performance is vastly superior. These filters are particulary suited to applications which require carefully controlled passband and stopband response as well as small size. These attributes are achieved through synthesis procedures and component topology unavailable for tubular designs. Models available with either SMA or BNC connectors for direct tubular replacement or maximum ground pin design permitting printed circuit board mounting for manufacturing convience and cost savings.

OSCILLATORS

For over twenty years, the CONNOR-WINFIELD Corporation has been producing high quality frequency control products for both military and commercial applications. CONNOR-WINFIELD has built an excellent reputation as a source of custom designed oscillators. We are also able to provide attractive discounts on large volume orders, but if you are in a hurry, our low volume lead times are consistently short on all standard models.

What follows is only a partial listing of the extensive oscillator capabilities we have available. We invite you to write or call us with your special oscillator requirements.

CONNOR-WINFIELD spotlights these new models:

★ECL-A,B	:	ECL logic in an all metal DIP-up to 180MHz (pg.1)
★S15R8	:	Low cost, fast delivery of TTL DIP oscillators—stock frequencies only. (pg. 2)
★C14R5L	:	Low current CMOS logic– <2mA. (pg. 1)
★SW44-1,2	:	Hi frequency Sine wave in an epoxy encapsulated DIP package- up to 200MHz. (pg. 2)
★C13R1,2,3,	:	Rugged non-xtal oscillator in a .2" high, all metal DIP package. (pg. 1)

STANDARD DESIGNS

CTS Knights offers standard crystals, available in **Resistance Weld, Solder Seal** and **Coldweld** packages. All three are available in the two basic holder sizes (HC-18 and HC-6), with pin or wire lead terminations.

CHART A shows standard part numbers which can be purchased by specifying only part number and frequency. The type of seal is indicated by the part number prefix.

R = Resistance Weld
S = Solder Seal
K = Coldweld

In chart A all part numbers have the R prefix. If you wish **Solder Seal** or **Coldweld,** change the prefix letter. When ordering standard crystals by part number, you will receive the following electrical specifications:

CALIBRATION TOLERANCE:

Solder Seal	±.003% @ 25°C
Resistance Weld	±.002% @ 25°C
Coldweld	±.002% @ 25°C

LOAD CAPACITY: Last letter specifies load:
A = 20 PF
B = 32 PF
C = series resonance

RESISTANCE: Specified on chart A

SHUNT CAPACITY: 7 PF Max.

STABILITY: ±.003% of 25°C frequency from −40 to +70°C

AGING:

Solder Seal —	< 10 PPM/YR
Resistance Weld —	< 5 PPM/YR
Coldweld —	< 3 PPM/YR

To order standard crystals, specify P/N and frequency. EXAMPLE: To order the basic HC-49 package size with wire leads, **Resistance Weld,** at 4.00 MHz, 20 PF load capacity, specify: "R1335-2-BA @ 4.00 MHz."

CUSTOM DESIGNS

Custom crystals include any which cannot be ordered by Specific CTS Knights part number. It does not automatically mean increased cost. Tighter specifications, detailed parameter testing, etc., involve additional cost factors.

Design limits are stated below. Your own specification can be written within these limits. This is intended as a practical window and does not exclude other designs. Query us first on State-of-the-Art needs.

HOLDER: **Resistance Weld, Solder Seal** and **Coldweld** holders are available. See outline drawings section. Note availability of hold-down top wires.

FREQUENCY RANGE: 1 MHz to 175 MHz (see chart A for holder vs frequency).

CALIBRATION: ±.0005 to ±0.1% @ 25°C

TEMP. STABILITY: ±.0002% to ±.01% of 25°C Frequency depending on temperature range.

TEMPERATURE RANGE: Common ranges are:
0 to 70°C
−30 to + 85°C
−55 to +105°C

PULLABILITY: If required (see Fig. 3)

LOAD CAPACITY: When designing your circuit, keep in mind that 20 PF, 32 PF and series resonance are common load capacities. Spec the load of your circuit. Loads between 15 PF and series can be specified without cost impact.

SERIES RESISTANCE (Rs): See performance curve

DRIVE LEVEL: 1-10 MHz 0.1 to 5.0 MW
Above 10 MHz 0.1 to 2.0 MW

SPURIOUS FREQUENCY: 6 db min. separation (2:1 for Resistance) is practical for any crystal frequency. Better attenuation is available in many areas.

To order custom crystals, describe the crystal in full, using the parameter format shown. Consult the factory if necessary.

PRECISION CRYSTALS

HIGH STABILITY PRECISION CRYSTALS 1 MHz - 40 MHz

Precision crystals are used in applications where long term aging of better than 2 PPM/YR is required. Two groups are available; those calibrated at room temperature and those calibrated at an elevated temperature, usually between 70° - 100°C, for ovenized oscillator use.

Frequency stability over temperature is tailored to customer's specific need. Frequency deviation over temperature may be held within $\pm5 \text{ x } 10^{-7}$ of the characteristic AT curve.

MIL-EQUIVALENT CRYSTALS

MIL-C-3098G requires special testing to ensure compliance with the entire specification. Any crystal marked with the "CR" number must receive this testing.

If your required crystal details match those of a mil spec in general parameters, but your commercial application does not demand the exhaustive testing, you can order a mil equivalent crystal. The design will be the same. The crystal **will not** receive the detailed testing. Marking will be standard commercial marking. The "CR" number will not appear on the crystal.

A mil vs commercial cross reference is shown below:

CTS Knights supplies crystals in four package sizes, (groups) of holders. Physical size and configuration distinguish each group. These are:

SPECIAL GROUP

- TO5 (HC-35/U)
- TO8 (HC-37/U)
- R2W (Similar to HC44/U)
- HC-40/U

Three sealing methods are used. "H" holders are solder sealed. "R" holders are resistance welded. "K" and "T" holders are coldwelded. These sealing techniques ensure long term isolation from external environments. Solder sealing, resistance welding and coldwelding are designed to meet the military leak rate specification. Pin-type leads are normally used in sockets; wire-type leads are common for circuit board use. Resistance and coldweld are intrinsically cleaner packages and thus have better reliability.

HOW TO SPECIFY A QUARTZ CRYSTAL

If the parameters for the crystal in question are not already covered by a MIL-SPECIFICATION or by a formal SPECIFICATION CONTROL DRAWING, then Items 1 through 6 are essential.

(1) **MODE OF OPERATION** i.e. fundamental, third, fifth, seventh, ninth or eleventh overtone.
(2) **HOLDER STYLE** i.e. HC-6/u, HC-18/u, HC-35/u, etc, depending on your individual application and the frequency.
(3) **CALIBRATION TOLERANCE AT REFERENCE TEMPERATURE** i.e. ± 20 ppm @ + 25°C, ± 5 ppm @ + 75°C, etc.
(4) **TEMPERATURE STABILITY** the allowable frequency deviation over a specified temperature range, with reference to the actual frequency measured at the calibration temperature. (i.e. ± 15 ppm, ± 2.0 ppm, etc.)
OR TOTAL TOLERANCE the total allowable deviation over a specified temperature range, with reference to the nominal frequency (i.e. calibration tolerance and temperature stability combined). (i.e. ± 50 ppm, ± 30 ppm, etc.)
(5) **OPERATING TEMPERATURE RANGE** the temperature range over which the temperature stability or the total tolerance is to be effective.
(6) **CIRCUIT CONDITION** will be either PARALLEL or SERIES resonance. If PARALLEL resonance, please state the load capacitance.

SPECIFICATION CODING

We use a system whereby we code the major parameters of a crystal specification using a combination of 9 digits. A typical code would be **A251DFE-32** and would be interpreted as follows. **A** = fundamental mode, **25** = HC-25/U holder, **1** = undercut pins per MIL-H-10056, **D** = calibration tolerance of ± 10 ppm @ + 25°C, **F** = temperature stability of ± 20 ppm with reference to the actual frequency measured @ + 25°C, **E** = temperature range of — 15°C to + 65 C over which the temperature stability is effective, **-32** = a circuit condition of parallel resonance and with a load capacitance of 32 pF.

DAMON *THE FORM FACTOR SPECIALISTS*

VCXOs — 1 KHz to 500 MHz

Damon VCXOs provide high stability over a broad range of center frequencies. An optional square wave or pulse output signal compatible with I. C. logic circuits is available.

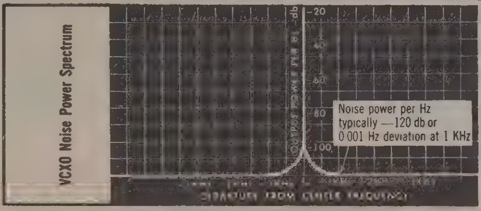
Center Frequency	1 KHz to 500 MHz
Deviation	.01% to 0.5% of Center Frequency
Linearity	1% to 5% of Peak Deviation
Frequency Stability	Determined by Peak Deviation and Operating Temp.
Modulation Rates	DC to 2 MHz

Low Noise VCXOs

Damon low noise miniaturized VCXOs are all solid state quartz crystal stable oscillators whose frequencies can be varied linearly by an external DC or AC modulating signal. Only a source of power and control signal are required . . . no auxiliary compensating circuitry.



TYPICAL CHARACTERISTICS:

Center Frequency	10.000 MHz ±1 KHz
Deviation	±10 KHz
Linearity	±1%
Modulation Rate	Flat to 4 KHz
Output Power	>1 MW

Gaussian Crystal Filters

Gaussian Crystal Filters of either conventional or monolithic design. Useful in FM communications or radar systems where flat time delay is required. In a coherent pulsed radar, it can minimize return-pulse overshoot. Eliminates ringing problems in swept spectrum analysis. Available in 2 to 8 pole designs.

EFRATOM is the recognized world leader in precision time and frequency systems for military/aerospace and commercial applications. Utilizing state-of-the-art atomic oscillator technology, EFRATOM has conceived and developed a family of time and frequency references that find valuable application in navigation, communications and laboratory environments. The ever increasing demands for precision time base hardware to perform in the harsh environments of space, military theatres and mobile communication platforms, have provided the impetus for the development of EFRATOM's range of atomic oscillators and time base generators.

EFRATOM's Model M-1000 is the world's smallest military atomic oscillator measuring just 3.25 in x 3.25 in x 4.5 in (83 mm x 83 mm x 114 mm), yet this instrument has excellent long term stability and fast warm-up performance. Developed specifically for military use, the Model M-100 and M-1000 rubidium oscillators are radiation hardened and offer unparalled performance in the toughest of airborne and ground environments.

Complimentary to its range of precision oscillators, EFRATOM offers the Model FRT ultra-stable atomic frequency standard for laboratory and field calibration. More recently, EFRATOM introduced its Atomic Oscillator Test Set, Model TS-105A, for frequency stability (Allan Variance) measurements, and a Phase noise Test Set, Model PNT-1000.

EFRATOM's scientists, in conjunction with NBS, have developed a Compact Passive Hydrogen Maser for commercial production (not pictured above, but specified below).

(CMOS) F1152 Series

Fox CMOS Oscillators generate a compatible output at any frequency specified from 25KHz to 12 MHz. The extremely low power consumption makes it perfect for driving CMOS MPU's or where battery backup is required. As with all CMOS circuits, power consumption and frequency range are dependent upon the selected input voltage.

The CMOS compatible output uses +5Vdc to +15Vdc.

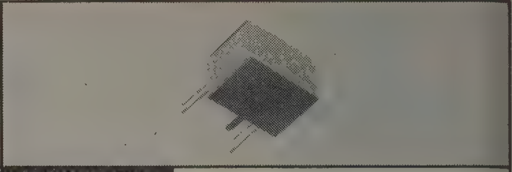
HC-18 Filter



Multi-Pole Filter

Monolithic Crystal Filters

Fox filters offer excellent features such as sharp cut off characteristic, low loss and high stability over wide temperature range which are superior to LC filters and ceramic filters.

The basic building block for all custom built Fox filters is the two-pole monolithic filter available in standard package as shown. (See Figure 12.)

Two-pole monolithic filters can be cascaded to produce four, six and eight or more pole filter responses with addition of coupling capacitors between two-pole sections.

Standard Fox filters are available with center frequencies at 10.7 MHz, 16.9 MHz and 21.7 MHz. Bandwidths from ±7 KHz to ±10 KHz and from two to eight poles.

SOME **FCP** SPECIALS

Microprocessor Crystals. Over 50 standard models for the frequencies from 1 to 48 MHz cover the most widely used microprocessors, clocks and ICs. All available in Coldweld HC-18 cans, some also in HC-33.

Crystals for Filters and Oscillators. Matched sets and high stability.

High Qs. Better than 1x10⁶ in some ranges, also spurious mode suppressions from 20 to 65dB.

Special Environments. High shock and radiation hardened.

Small Packages. 10 MHz in TO-5 (HC-35/U) can, .700 to 1.5 MHz in .215″ high HC-18 coldweld.

Clock Oscillators. Feature crystal stability, printed circuit board on dual in-line mounting and outputs directly compatible with DTL or TTL loads. Full line—Military and Industrial Clock Oscillators.

For more than 25 years **FCP** has been a major supplier of crystals for MIL Spec, general industrial and special applications. A wide variety of packages are available in coldweld and solder seal. Strong on engineering as well as production, Frequency Control Products can often be of assistance to the circuit designer.

SATELLITE FREQUENCY GENERATION AND DISTRIBUTION EQUIPMENT

State-of-the-art techniques pioneered by FEI for frequency synthesis, processing, and distribution of low noise reference signals have been applied to the development of high reliability hardware for satellite applications. FEI systems consisting of precision oscillators and distribution equipment configured as redundant assemblies are presently being used on a wide variety of space programs resulting in performance capabilities previously unrealizable. The equipment incorporates FEI's high reliability hybrid techniques and results in light weight and low power consumption; considerations of primary importance in satellite applications.

GET ORGANIZED!

Are your catalog files organized? Can you find any given catalog in a matter of seconds? If your answer is "Yes," you probably already have the EEM File System. But, if you said "No," you really ought to look into this simple system. It will save hours of time and tons of aggravation.

The EEM File System was invented over twenty-five years ago to help people who specify, buy, or work with electronic products and equipment. It is upgraded on a constant basis to reflect the current state of the art. It's easy to use and easy to customize to your particular needs.

You say you want to file catalogs by type of product? That's easy to do with The System. But, what are you going to do when there are multiple products in one catalog? Take Mallory for example. There are all kinds of products in the Mallory Short Form Catalog. With the EEM File System all you do is file the catalog under "M" for Mallory and refer to it on all of the cross reference cards that apply.

There are thousands of EEM File Systems in everyday use in engineering and procurement offices all over the world. Shouldn't you be using this proven system?

The EEM File System is shipped in one neat package. The package contains everything you need to set up your very own filing system. Best of all, it's easy to get and very affordable. Send a check or money order for $25.00 and EEM will pay the postage and sales tax. If you must use a purchase order, please add $5.00 for postage and handling. An invoice will accompany your System.

Don't waste any more time. Get organized now!

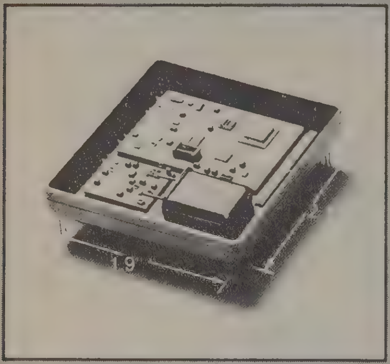
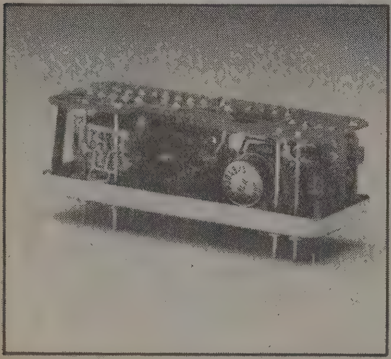
Hughes Oscillators





Temperature Compensated Crystal Oscillators

For portable or remote equipment requiring low power and high stability, Hughes offers both TCXO's and DCXO's. The TCXO's utilize analog compensation networks designed with computer aided techniques to achieve frequency stability over wide temperature ranges. Performance is ensured with automated component selection and test and fully automated testing of the finished product. DCXO's achieve even greater frequency stability through digital compensation techniques. Compensation data is stored in an Electrically Erasable Programmable Read Only Memory (EEPROM) which allows the DCXO to be recompensated or programmed a number of times.

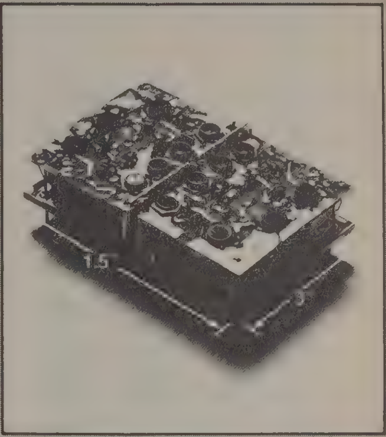
Hughes Custom Filters and Oscillators

Crystal Filters

Hughes has over 20 years of experience with all standard types of bandpass filters, including Butterworth, Chebychev, Elliptical, Gaussian and Bessel types, as well as band reject filters and crystal discriminators.



Characteristics

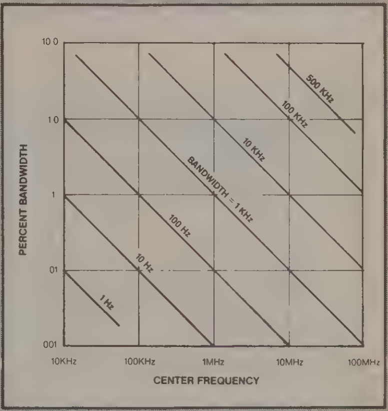
Hughes filters are designed using advanced computer-aided network synthesis and analysis techniques resulting in filters with sharp selectivity, controlled group delay or phase response, non-ringing pulse response and low insertion loss over broad temperature ranges. Hughes has also developed proprietary designs which permit tight control of phase and group delay characteristics or time domain response characteristics such as peak overshoot and ringing in response to pulsed RF signals. Hughes Frequency Control Devices meet the most stringent military standards, when required.

Applications

Hughes Frequency Control Devices are in use in satellites, radar systems, missiles, military and commercial communications and avionics systems.

Typical Specifications

Fractional Bandwidth:	See Graph at right
Shape Factor:	As low as 1.15 to 1 (60 dB/3 dB ratio)
Passband Ripple:	Down to 0.2 dB
Phase or Delay Compensation:	To within ± 1%



How to Determine the Feasibility of Your Filter

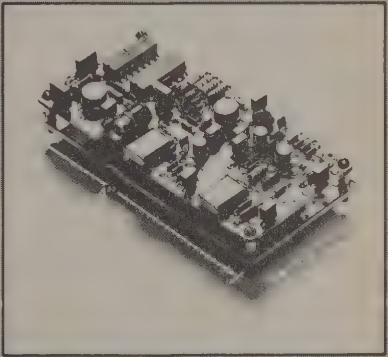
The graph at right shows the general operating region of Hughes filters as determined by center frequency, bandwidth and/or percent of bandwidth. If your filter falls within the white area, Hughes can readily design and produce such a filter. If your filter falls outside the white area but near the boundaries of this chart, you should discuss your requirements with the Hughes design engineering staff, since your filter may still be practical to produce.

Voltage Controlled Crystal Oscillator

Hughes VCXOs offer wide frequency deviations, up to ±0.3% of the nominal oscillator frequency. For extended temperature ranges TCVCXOs are temperature compensated to provide exceptionally low frequency drift characteristics.

Typical Specifications

Frequency Range:	100 Hz to 120 MHz
VCXO Temperature Range:	−40°C to +70°C
TCVCXO Temperature Range:	−55°C to +85°C
Deviation:	±0.3%
Linearity:	± 1%
Spurious:	80 dBc
Supply Voltage:	8 to 27 V_{DC} available
Outputs available:	Sine, TTL, ECL
Size:	As small as 2 x 2 x 0.5 inches Hybrid versions available



Crystal Processing

Hughes designs and processes our own crystals for use in our filters and oscillators. These crystals are either open construction (mounted to a substrate and hermetically sealed) or individually packaged. Computerized testing of crystal parameters over temperature range is utilized extensively for phase and gain matched filters.

Quartz Crystal Oscillators

The ITT DIL oscillator series are miniature, low-profile, dual-in-line quartz crystal oscillators in a hermetic package. They are designed primarily, to meet the needs of the fast growing minicomputer and microprocessor markets, but are suitable for many other applications where a reliable, accurate clock input is required.

Frequency tolerances ranging from 1000ppm to 25ppm are available.

ENVIRONMENTAL TESTING / QUALITY CONTROL

Within a building separate from the manufacturing area, the environmental test lab continuously maintains Leach QPL listings and conducts qualification testing to customer requirements.

Testing in accordance with MIL-STD-202 includes:

- Sine vibration with concurrent temperature testing
- Shock
- Altitude/temperature altitude
- Thermal shock and temperature cycling
- Load and life testing

HISTORY OF HIGH QUALITY ELECTRONICS

The need for high quality thick film hybrid microcircuits for aerospace and military applications lead to Leach Corporation's entry into the field in the early 1970's. The initial 400 square foot engineering lab has evolved into a 22,000 square foot facility housing both engineering and total manufacturing capabilities.

Products include both analog and digital circuitry for interface and switching applications, and consist of both proprietary Leach products and customer designed custom hybrids.

MANAGEMENT PHILOSOPHY

Primarily designed for high reliability applications, products are manufactured to MIL-STD-883 requirements. Military environmental specifications and criteria are standard Leach practice, and products are qualified to MIL-R-83726, MIL-M-38510, and NASA standards.

HYBRID MANUFACTURING FACILITIES

Total facilities for all aspects of thick film hybrid manufacturing as well as hybrid/electromechanical interfacing are contained within the manufacturing area.

- Screen and firing
- Trimming
- Wire bonding
- Eutectic and epoxy die bonding
- Reflow soldering
- Photo processing
- Computerized testing of hardware
- Laminar flow benches
- Inert storage atmosphere

KOLDWELD CRYSTALS STABILITY RELIABILITY

Monitor's KTO Series Frequency Control Crystals are an extension of Monitor's capability in applying KOLDWELD techniques to crystal packaging. These high reliability, low aging crystals offer precision frequency control in a subminiature package (TO-5 transistor package). The KX type crystals conform to the dimensions and requirements of standard military type HC holders and are ideally suited to extreme environments. The KX type can be used as replacements for standard HC-6, HC-18 and HC-13 mil-spec units.

Monitor also manufactures a complete line of crystals (HC-6/U, HC-18/U, HC-13/U, HC-25/U) to MIL-C-3098 (4 KHz - 200 MHz).

MDO-2 Series

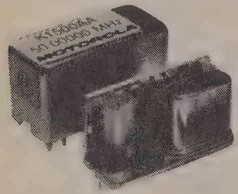
Inclusive ±2 ppm Stability, Full Hermetic Seal

The ±2 ppm frequency stability of the MDO-2 oscillator series is inclusive of voltage and humidity variations while operating over a wide temperature range from −35°C to +85°c. The all-metal welded package offers a full hermetic seal which keeps the oscillator on frequency in environmental extremes of temperature and humidity — high performance with small size (0.8″ x 0.8″ x .480″ high).

MDO-1 Series

±1 ppm Stability Full Hermetic Seal

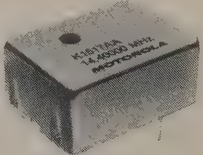
The MDO-1 Series oscillator is an ideal substitute for an ovenized oscillator in many applications while using considerably less space. The ±1 ppm stability is maintained over the full temperature range of −30°C to +90°C. The MDO-1 is contained in an all-metal, welded package for full hermetic seal and for minimized RFI.



MTO-2 Series

Small Size Low Power Consumption

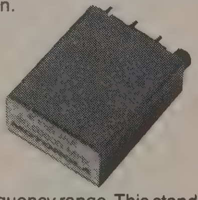
The MTO-2 oscillator series offers optimum performance in a package less than 0.16 cubic inches, making this oscillator ideal for those communication equipment applications in which low power consumption is required.



MTO-1 Series

Inclusive ±5 ppm Stability

The ±5 ppm frequency stability including supply voltage and load variations over the full operating temperature range of −30°C to +85°C makes the MTO-1 oscillator series ideal for those low cost applications in which maximum reliability is needed over an extended temperature range. Optionally available with tighter stability and with frequency modulation.



MSO-1 & 2 Series

The MSO oscillator series, specially designed for communications equipment, is available over a wide frequency range. This standup version uses minimal boardspace area. Tight stability and frequency modulation are optionally available.

Monolithic Crystal Filters

The disciplines of physics, electrical engineering, and material science are combined with computer-aided Monte Carlo design techniques to create optimum state-of-the-art monolithic crystal filters. Several patented techniques have thus been developed to improve spurious response, stop-band rejection, and intermodulation levels. A broad capability exists to design discrete filters and monolithic filters from two to twelve poles, with frequency capabilities from 5 MHz to 200 MHz.

Motorola offers a complete line of standard filter models designed for use in communications equipment requiring IF filtering. Some of the more popular frequencies at 10.7 MHz, 21.4 MHz, and 45.0 MHz are readily available in a variety of package styles. DATA CLOCK OSCILLATORS

ASCO Data Clock Oscillator TTL Compatible CMOS Compatible

ASCO oscillators are a new, high quality family f data clocks based on a custom integrated ciruit, making possible a drastic reduction in interal parts count. This reduction in discrete comonents results in greatly improved reliability. The ustom IC also provides several performance adantages: reduced current drain, improved output aveform, and ability to drive both CMOS and TTL gic. At frequencies from 3 to 25 MHz, RASCO locks are available in a variety of output capabilies and tolerances, as shown by the following:

MODEL IDENTIFICATION

RASCO 2 C S E

Stability —— 2
CMOS/TTL —— C
Symmetry —— S
Enable/Disable —— E

Stability — the number in this position signifies e frequency stability specification of the parcular model per the following chart:

MODEL	STABILITY
RASCO 0	±0.005%
RASCO 1	±0.01%
RASCO 2	±0.05%
RASCO 3	±0.1%
RASCO 4	±1.0%

CMOS/TTL — models with TTL compatibility ave no designator here, while CMOS compatible odels are designated by the letter "C." Thus, a ASCO 3C is a CMOS-compatible model with 0.1% stability, and a RASCO 1 is TTL compatie with stability of ±0.01%

Symmetry — tight symmetry (45/55%) models e indicated by an "S" suffix. Models with no S" suffix have the standard 40/60% (worst case) mmetry specification.

Enable/Disable — the enable/disable feature indicated by an "E" suffix.

is possible for a model to require all 3 letter esignators; for example, a ±0.01% CMOSompatible model with tight symmetry and enble/disable would become model RASCO CSE.

K11000 Low Cost DIP Crystal Clock Oscillator

The K11000 makes use of the proprietary custom integrated circuit developed for the RASCO oscillator. In addition, new, proprietary crystal technology allows the crystal to be miniaturized to a greater degree than previously considered practical. CUSTOM FILTERS
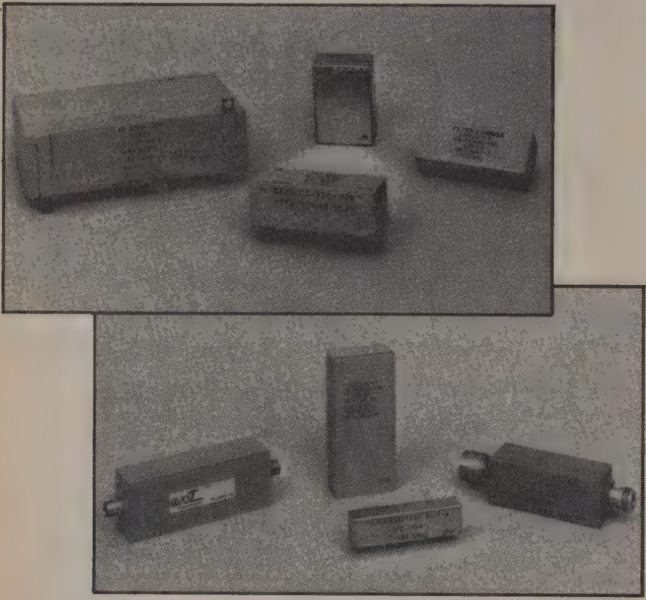
Engineering & Manufacturing

DISCRETE CRYSTAL FILTERS • LC FILTERS AND NETWORKS • MONOLITHIC CRYSTAL FILTERS



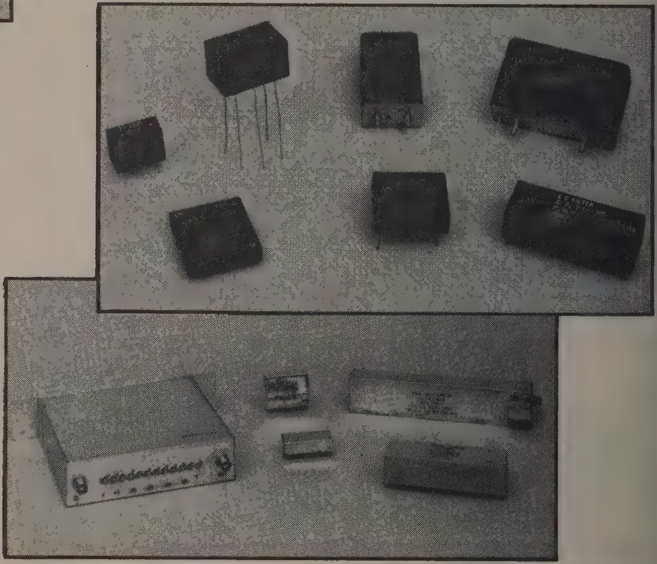
OPT is at the forefront of filter engineering as a result of company sponsored research and development in addition to the technology gained thru the acquisition of all engineering drawings and manufacturing rights from the following companies:

- Bulova Filter Co.
- Burnell & Co.
- Filtech
- Nytronics
- Omnitec
- Ortho Filter

Broad application experience supported by a library of computer synthesis, analysis and optimization programs, assist in supplying the best solution to specific requirements.

OPT is unique in being able to provide in depth engineering support on prototype development as well as quality controlled manufacturing capacity to supply high volume requirements.

Component stabilization procedures permit guaranteeing maximum stability with operating life. Areas of specialization include delay correction, phase matching and time domain synthesis.

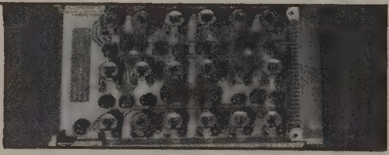


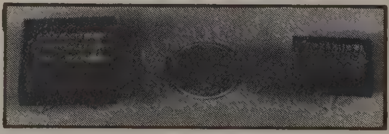
OPT's custom engineering and manufacturing capabilities for monolithic crystal filters range from 4.0 MHz to 30 MHz with relative bandwidths from .04% to .3% of center frequency. Discrete crystal filters range from 1 KHz to 70 MHz with relative bandwidths upwards from .005% of center frequency.

LC Filters and networks include low pass, band pass, high pass, band reject, amplitude and delay correcting, impedance matching in frequencies ranging from DC to 400 MHz with relative bandwidths higher than .2% of center frequency where design permits.

OPT's success in meeting and achieving new goals is reflected in our continued participation in many advanced military programs as well as high quality communication systems.

OPT, in addition to complying with MIL-F-18327 has on certain programs complied with MIL-Q-9858A requirements.





(Above) NASA high reliability bandpass filters for use in space shuttle telemetry system. Built to MIL-STD-810C, method 514.2, proc. 5, part 2, curve AH; shock MIL-STD-202, method 213B, cond. k; temp. −30°C to +75°C.

(Top Right) Phase and amplitude matched filters for sonobuoys and phased array sonars. Temp. −20°C to +65°C. Phase is matched over temperature to <3° for any number of channels.

(Bottom Right) Ultraminiature passive low pass filters stable over temperature. Used in codec inputs and secure communications CVDT's.

Special VHF Monolithic Filters

PTI offers the industry's widest selection of VHF monolithic filters. While most VHF four-pole crystal filters require stable, critically-tuned, high-Q, interstage inductors or transformers, the PTI models in the table below do not. Models 2843, 2844, and 3020 are two-pole devices; Model 6437 is a fundamental mode, four-pole tandem monolithic filter; the remaining models are full monolithic (single-wafer) four-pole devices, and are completely self-contained. These are offered both in a single crystal enclosure and packaged with matching to 50 ohms. All packages are hermetically sealed, PC-board mount. Customized packaging and specifications are available for your special production requirements.

VHF Front-End Filters

The models listed below consist of 2-pole monolithic and 4-pole tandem monolithic filters designed for use as front-end filters in low-band and high-band VHF custom applications. They are also suitable for HF up-conversion, first IF filtering and spectrum clean-up in frequency synthesis. Nominal operating frequency is specified by the customer in the 25 MHz to 200 MHz range.

All models operate over a temperature range of −20°C to +70°C. Filters are matched to 50 ohms with a convenient phono-jack, BNC, or a variety of other connectors. See package drawings, VB* series. See table below for detailed specifications.

MINIATURE CRYSTAL CLOCK OSCILLATORS

STANDARD PACKAGES AND FREQUENCIES

Q-TECH can supply oscillators in a wide variety of package types, including TO-5 (8 lead), TO-8 (8 or 12 lead), DIP (14 or 16 lead), FLATPACK (QT21 and QT22), and LCC (QT61 and QT66). These are available over a very wide range of frequencies from fractions of a Hertz to UHF. Please consult us for your custom requirements.

FREQUENCY RANGES AVAILABLE

Package Type	Package Size	C-MOS Frequency Range	TTL Frequency Range
TO-5	QT1	50KHz to 15MHz	20KHz to 30MHz
TO-8	QT2, QT3 or QT8	300Hz to 15MHz	100Hz to 25MHz
14 Pin DIP	QT4 or QT6	.1Hz to 15MHz	.1 Hz to 60MHz
16 Pin DIP	QT5 or QT7	.1Hz to 15MHz	.1 Hz to 60MHz
20 Lead Flat Pack	QT21, QT23	1.0Hz to 15MHz	1Hz to 60MHz
16 Lead Flat Pack	QT22	50KHz to 15MHz	25KHz to 30MHz
Leadless Chip Carrier	QT61 & QT66	30KHz to 15 MHz	20KHz to 60MHz

SPECIAL PACKAGES AND ENCLOSURES

Q-TECH can provide units to unusual package requirements including miniature units withstanding 10,000 PSI and Flat Packs with less than .100 inch thickness. Ultra-thin (.065) ceramic leadless chip carrier packages available with frequencies to 60 MHz.

C-MOS CLOCK OSCILLATORS

Frequencies available in the C-MOS line of oscillators are related to input voltage. It is essential, therefore, when ordering a C-MOS unit to specify the input voltage.

Power requirements of C-MOS units are related to both frequency and input voltage. Most of the power is dissipated within the crystal oscillator portion of the device, and buffering, division, or other logic requirements within the unit contribute little to the total power consumption.

ECL/VHF/UHF CLOCKS AND SOURCES

ECL and sine wave clocks and sources are available to 400 MHz.

Q-Tech can work with you to hybridize high stability and synthesized sources up to 3gHz.

Phase noise and G-Sensitivity data are taken when required. Full temperature range, −55°C to +125°C, available for these clocks and sources.

Crystal Products

Crystals of proven reliability for military and industrial applications

For 40 years, Reeves-Hoffman has been a leader in the design and manufacture of quartz crystals for government and industry. We are the only company offering the improved stability of coldweld sealing at a lower cost than conventional solder-sealed units.

All Reeves-Hoffman crystals are cut, ground, polished, plated, and mounted at the factory to exacting specifications. Shock, vibration, and hermeticity characteristics all exceed Mil-Spec C-3098. Crystals for oscillator and filter applications are available from 1 kHz to 200 MHz, with varying temperature coefficients, effective resistance, electrical equivalents, and Q values dependent on physical limitations and circuit requirements.

The staff of crystal engineers at Reeves-Hoffman welcomes the opportunity to quote on and discuss your particular application.

Ask for our free booklet, "A Specifier's Guide to Quartz Crystals," written to reduce your design problems.

When specifying crystals, please supply the following:	Crystal Categories
1. Frequency required 2. Holder style 3. Calibration temperature/ tolerance 4. Oscillator load capacitance 5. Temperature range 6. Maximum series resistance 7. Stability over temperature	**Oscillator Crystals** • **Industrial** Aging: 5 to 25 x 10−⁶ per year • **Precision** Aging: Less than 5 x 10−⁶ per year or less than 5 x 10−⁸ per day after first 30 days. • **Military** (per Mil C-3098) **Filter Crystals** See facing page

Low-Frequency Crystals

1.0 to 1200 kHz in standard and miniature holders

Throughout our long history as a quality supplier of low-frequency crystals, Reeves-Hoffman has dedicated our efforts towards responding to the changing needs of the electronics industry. As miniaturization reduced the size of electronic equipment, the traditionally large low-frequency crystal became one of the largest components in the system. To respond to this, Reeves-Hoffman worked closely with the crystal users. As a result, miniature crystal holders such as the RH135, RH170, RH605, and RH3X8 were developed. This is just one example of Reeves-Hoffman's ingenuity and responsiveness to the needs of our most important asset...our customers.

The choice of element will vary. However, Reeves-Hoffman will choose the best element for your specific requirements based on cost and performance considerations.

High-Frequency Crystals

1.0 to 200.0 MHz

The use of high-frequency crystals has grown continually over the years as timing rates, tranmission frequencies, and data-processing speeds increased. Fortunately, Reeves-Hoffman is continually involved in this evolution to the extent that we possess the capabilities to respond to just about any requirement for high-frequency AT-cut crystals. In the past, many challenges have been presented to our engineering and manufacturing personnel. We are extremely proud of their response record, and look forward to working with you to continue this trend.

Crystal Filters

Reeves-Hoffman custom designs and manufactures passive quartz crystal filters to meet the exacting specifications of companies at the leading edge of technology.

By utilizing computer-aided design and analysis, our staff of professionals can solve your most perplexing problems. Computer controlled frequency synthesis and network analysis provide accurate testing of amplitude, phase, and delay to assure precise filter performance. Image parameter, modern network theory (Butterworth, Chebyshev, Bessel, Gaussian, Cauer) and Lerner synthesis techniques are employed to obtain the desired frequency response.

Because of Reeves-Hoffman's military approved crystal manufacturing capability, we are able to produce quartz crystals which will satisfy the demands of the filter design. The high standards of our Quality Control Department assure that both crystals and filters are manufactured and tested to applicable military specifications.

SAW Resonator Products

Surface Acoustic Wave Technology provides performance advantages and design flexibility that has proven to be invaluable to engineers in need of reliable, reproducible components featuring linear phase, temperature stability, small size, low shape factor and excellent rejection. Increasingly, SAW technology is meeting the exacting requirements of modern systems with high performance resonators, resonator filters, oscillators, and other state-of-the-art signal processing components such as pulse compressors, delay lines, and bandpass filter products. In addition to this broad product line, Sawtek provides the total engineering support needed to make the proper design trade-offs among key parameters in order to achieve the optimum performance available from SAW technology.

Sawtek produces hundreds of standard SAW products for both low and high volume programs in Cable Television, Satellite Communications, Modems, Radar, EW, and many other signal processing applications. In addition, Sawtek's custom design capability can provide technical assistance and rapid response to new design and production requirements at frequencies from 10 MHz to more than 1 GHz. Sawtek also designs and produces custom subsystems which incorporate SAW components. These include filter banks comprised of cascaded filters packaged in a single assembly, amplifier-filter modules with adjustable gain, and SAW resonator-controlled oscillators. Some of the common SAW resonator products produced by Sawtek and their characteristics are summarized below.

SAW RESONATORS

Sawtek offers SAW resonators at fundamental frequencies from 100 MHz to more than 1000 MHz. These are high Q components which are primarily intended to be used in oscillators and are also used for both bandpass and notch filters. Sawtek resonators are inherently spur free in oscillator applications, exhibit low motional resistance, and have a pulling range comparable to a 3rd overtone bulk wave crystal. Typical values of R_s range from 15 Ω to 150 Ω and capacitance ratios are nominally 2000:1. Incorporation of special metalization improves oscillator noise performance by permitting drive levels up to +20 dBm. These quartz devices can achieve temperature stability of less than 50 PPM from 0°C to 60°C. Both one-port and two-port configurations are available.

Sawtek maintains a large inventory of pre-tooled SAW resonator crystals including many frequencies for CATV convertor applications. New designs can also be tooled rapidly to meet custom requirements. The 668 MHz resonator shown below is representative of Sawtek's low-cost standard products.

SAW OSCILLATORS

SAW resonator-controlled oscillators are currently produced by Sawtek for military and aerospace systems. Because they are able to operate at fundamentals of over 1000 MHz, SAW oscillators simplify design, reduce cost, and improve noise performance through the elimination of multiplier stages. In many applications it is also possible to achieve adequate power in one stage to directly drive a mixer and thereby eliminate the need for a buffer/amplifier stage.

Typical of the company's oscillator products is a fixed frequency, oven stabilized SAW resonator oscillator at 740 MHz. All spurious and harmonics are down 60 dB; the short-term stability is $\pm 2.5 \times 10^{-10}$ for 1.0 to 25 second averaging times and the phase noise is 120 dBc/Hz for a 2.5 kHz offset. The frequency versus temperature stability of this miniature ovenized unit is ±2 PPM from −15° to +60°C. A maximum power consumption of only 1.75 watts at −15°C ambient is achieved. Sawtek also offers assistance in oscillator design for low-cost consumer and commercial applications and is prepared to help evaluate the suitability of SAW oscillators for each new application.

SAW RESONATOR FILTERS

SAW resonator filters provide high rejection and low loss for narrowband applications requiring 0.01% to 0.25% fractional bandwidths. This family of Sawtek's resonator filters is characterized by a "new shape" in narrowband filter technology. The unique shape demonstrated in the performance photographs below arises from the combination of transversal filter and resonator characteristics: the narrowband response produced by the resonant cavity emerges from the broader passband of the input and output transducers.

Two pole versions typically exhibit from 2 dB to 5 dB insertion loss with 15 dB to 20 dB near-in rejection and 55 dB to 75 dB ultimate rejection. The two-pole 537 MHz resonator filter shown on the left below has a matched insertion loss of only 4.5 dB, 18 dB close-in rejection, and 60 dB ultimate rejection.

Rejection which is beyond the measurable range of most test instruments can be achieved by cascading these two-pole units into multipole configurations. Depending on the number of poles, this technique provides from 20 dB to 60 dB of near-in rejection, improved shape factor and reduced flyback. Insertion loss generally increases at a rate of less than 1 dB per pole for these filters. The six pole 149.3 MHz filter on the bottom right has an insertion loss of only 5.7 dB and an ultimate rejection of over 100 dB.

Sawtek's resonator filters are provided in individual two-pole stages in TO-8 and TO-5 packages and in custom modules when several of these 2 pole units are cascaded. Sawtek offers standard resonator filters and also rapid custom design.

SMALL WORLD, ISN'T IT?

Modern communication is making the world smaller — and our universe larger. From belt pagers to space relays, communication tightens our human network, and extends our influence to the stars. A key ingredient in communication science is and has been crystals and crystal filters. That's what we make at Sokol.

Our specialties (see graphs) include monoliths, discretes, crystals, and time delays — in a fundamental frequency range of 1-100 MHz, with overtones to 500 MHz. Standards and classics we can ship yesterday. But innovation is what we thrive on. We offer:

MINIATURIZATION. We make the smallest matched set of filters in the industry. Our HC45 package matches or beats performance specs for similar fundamental crystal filters at about 1/3 the size. (And would you believe frequencies above 20 MHz in a package 1/10" diameter by 1/4" high?)

ENGINEERING ASSISTANCE. If what you need exists only as a hole in your schematic, we provide engineering assistance, and the optimum solution in terms of performance, price, and durability. So send us your specs. We'll never say, "This will do." *You* have to say, "This is it!"

QUALITY. We test to any MIL spec, and can handle shock to 2,000 G's, vibration to 3,000 Hz, corrosion, heat, humidity and altitude. Immaculate handling of high quality crystal blanks, and precision testing assure pinpoint performance and maximum working life. As a matter of national pride, we make sure our products surpass imports in all parameters. Including price.

All of which goes to show, you never know who you might run into. Even just leafing through a magazine. We're pleased to let you know that the solutions to your communication engineering needs are only a phone call away.

Small world, isn't it?

Surface Mountable Crystals and Oscillators

CX-1 and CX-2 Series crystals are available in higher-temperature leadless versions for surface mounting. SQXO-2 Series oscillators are available in a 24-pin leadless ceramic chip carrier for surface mounting. Surface-mountable crystals are designated CX-1 (H or V)-SM or CX-2 (H or V)-SM, and surface-mountable oscillators are designated SQXO-2-SM.

All Statek surface-mountable devices are designed for use with vapor phase solder reflow processes and wave solder processes up to 260°C. See individual data sheets for specifications.

OUT:	Supplies base frequency of internal crystal oscillator.
XC:	Input for counting external clock instead of internal clock.
CSEL:	Clock select. Setting this terminal Hi causes the divider to count the frequency of an external clock instead of the internal clock.
RESET:	Setting this terminal Lo resets all counters and sets output switches to Lo.

(All inputs except EXC and RESET have internal pull-down resistor. RESET has pull-up resistor.)

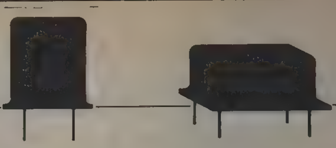
VALPEY-FISHER
A SUBSIDIARY OF MATEC



MICROPROCESSOR CRYSTALS

Valpey-Fisher quartz crystals are ideally suited for microprocessor applications. They feature low series resistance, precise frequency setting, and a stable frequency tolerance with temperature. Our high reliability production process assures outstanding long-term stability.

Listed are most of the common microprocessor frequencies, a sampling of the microprocessors in which they are used, and the Valpey-Fisher part number for crystals of these frequencies. Other frequencies are available upon request.

All crystals are available in the miniature HC-18/U holder. The small size of this holder makes it ideal for use in densely populated printed circuit boards. To minimize spacing between boards, an engineer may mount the crystal on a plane parallel to the board and support it with the optional third lead or hold-down pin.

Frequency tolerance: ±.005% @ 25°C
Stability tolerance—all types (except VF100):
±.01% from −20°C to +70°C
(VF100): ±.02% from −20°C to +70°C
Static Capacitance, C_0, all types (except VF100):
7.0pf maximum
(VF100): 4.0pf maximum

MIL-C-3098 CRYSTALS

Valpey-Fisher has demonstrated over 50 years of leadership in piezoelectric technology. Since 1931 the performance and reliability of Valpey-Fisher crystals have contributed to the defense of military efforts of our country.

Below are the specific CR types for which the Department of the Air Force and the Defense Electronic Supply Center have added Valpey-Fisher to Qualified Products List (QPL) 3098. The CR number applied to each crystal is a complete specification and defines the frequency range, frequency tolerance, capacitance holder type and environmental conditions. Merely specify the desired frequency.

xtending the Military Range of Frequencies

quivalent Valpey-Fisher crystal types cover, but are not limited to, the frequency ranges shown for Military units. For example IL type CR-64/U covers the fundamental mode range of 2.9 to 20.0 MHz in the HC-18/U miniature holder. The Valpey-Fisher ersion, using the same holder, covers from 1.843 to 30.0 MHz.

Please inquire as to the actual range of frequencies available for commercial versions of the MIL types.

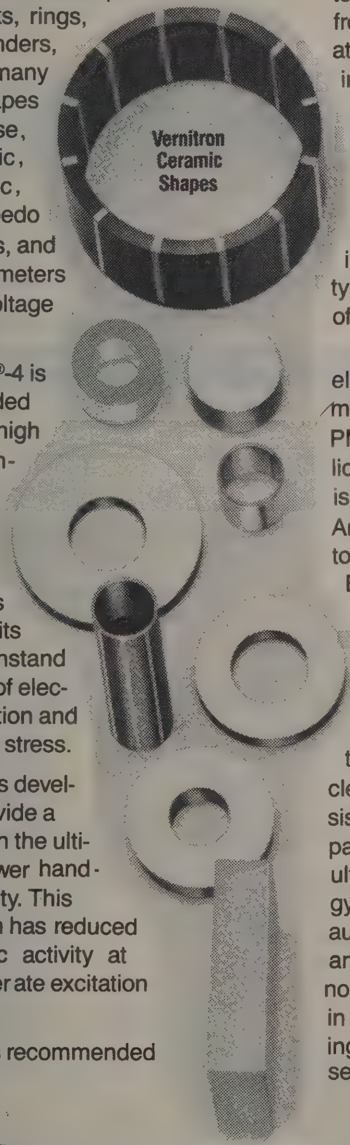
Electronic components and piezo ceramics by Vernitron. 45 years of innovation.

In piezo ceramics of diverse shapes. In Bimorphs and Unimorphs. Also in ceramic bandpass and ladder filters. In ceramic resonators. And in piezo igniters. That's Vernitron Piezoelectric Division.

We've been making innovations in electronic components and piezo ceramics since 1938. And we're still doing it. Take a look at some of our accomplishments in modern ceramic shapes. We've developed discs, blocks, rings, plates, cylinders, tubes and many custom shapes for sonar use, as ultrasonic, hydrophonic, and as torpedo ransducers, and n accelerometers and high voltage generators.



Vernitron Ceramic Shapes

Our PZT®-4 is ecommended or use in high voltage generators and high power acoustic adiating ransducers because of its ability to withstand high levels of elecrical excitation and mechanical stress.

PZT-8 was developed to provide a material with the ultimate in power handling capability. This composition has reduced piezoelectric activity at ow to moderate excitation evels.

PZT-5A is recommended for use in receiver or generator type transducers such as hydrophones, fuses, accelerometers, and vibration pickups in general etc., because of its high sensitivity, permittivity and time stability.

PZT-5H is better suited to low frequency applications because of increased permittivity, accompanied by a reduced Curie point.

The family of PZT-5 materials may also serve in very low power motor-type transducers because of high motion sensitivity.

Vernitron also has developed lead metaniobate materials, PMN-1 and PMN-2, for diverse applications. Their feature is higher Curie points. And we are the originators of Unimorphs and Bimorphs to serve as compact transducers for audio tones.

The above compositions are used in such applications as ultrasonic cleaners, kidney dialysis equipment, heart pacemakers, ink jets, ultrasound scanners, gyros, sonobuoys, automatic erasers and a variety of noisemakers. Also in laser positioning and as motion sensors.

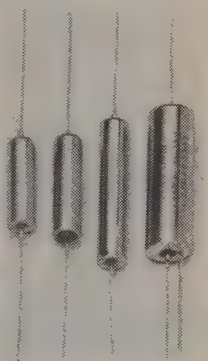
Bandpass Filters and Resonators

Innovation is also true of our work in bandpass filters, ladder filters, and ceramic resonators. We offer light weight, stable, fixed tuned, miniature ceramic filters and resonators with varieties for almost any kind of communications equipment:

consumer —
commercial —
military.



Ceramic Ladder Filters

And don't overlook what we've done in piezo igniters for gas fired equipment of all types. Vernitron igniters are original equipment in most makes of barbeque grills, as well as in many furnaces, water heaters and camping lanterns. Vernitron igniters are the world industry standard.

So if you're working with piezo ceramics, in alarms, speakers, lasers, sonar, ink jet printing data processing, communications, telephone development, gyros, or hydrophones, pacemakers or gas-fired equipment give us a call and put our 45 years of innovation and experience — going on 46 — to work.

SELECTING BASIC MODEL:

1. Select "Ultra Stable" if 3 x 10^{-10}/day aging or better is required; otherwise select "High Stability"
2. Select operating temperature range required (**A**, **B**, **D** or **G** from left column under "Temperature").
3. Select frequency stability desired over temperature, this determines the oscillator. (Temperature stability improves from left to right).
4. Select desired aging rate within Series to complete basic model number.
5. Determine whether you desired a low-noise option or any characteristic which is not standard (e.g., supply voltage, output level, etc.).

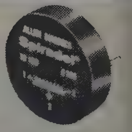
SPIRADEL* THE MOST COMPACT

Highest Time Delay to Rise Time Ratio DISTRIBUTED DELAY LINE

FOR IMMEDIATE DELIVERY!



SPIRADEL is a small diameter, distributed constant fixed delay line, featuring higher delay to rise time ratio and excellent pulse fidelity. Its new shape offers greater package design versatility than most other delay lines available, and the entire unit is encapsulated for maximum environmental protection.

SPIRADEL covers a delay range of 20 to 6000 nanoseconds. Any delay within this range may be selected.

Time delay to rise time ratios range up to 30 to 1. Any impedance from 50 to 1000 ohms is available. Standard delay tolerance is 5%, although tighter tolerances can be held.

SPIRADEL is designed for operation from −55°C up to +105°C. Temperature coefficient over this range is 150 parts/million/°C. Bandwidth is from DC to frequency f = .35/rise time.

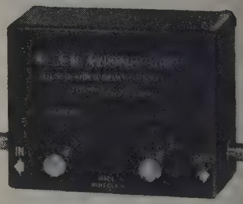
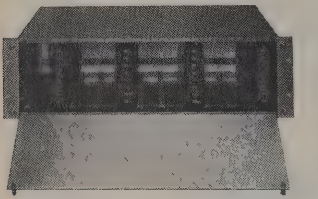
THE MOST COMPLETE LINE OF VIDEO DELAY LINES AVAILABLE FROM STOCK!



Allen Avionics, an established leader in the design and manufacture of Electromagnetic Delay Lines and L-C Filters has now developed a specialized group of products for the video market.

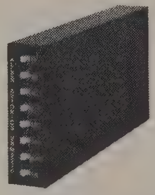
In color television broadcasting, accurate timing of signals is essential. This was initially achieved by the use of 75 ohm coaxial cable. The cost in time and materials to accomplish precise trimming and the lack of a rapid and convenient method of changing delays is currently responsible for the decline in cable usage. Television studios, studio equipment manufacturers and others engaged in the video industry are changing from 75 ohm cable to a more suitable method of achieving precise short delays. Allen Avionics now offers a line of Video Units for this purpose. Their use will result in a reduction of size, weight, installation cost and an overwhelming saving in time and effort to make delay changes.

RACK MOUNTABLE UNITS



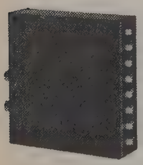
RACK MOUNT showing delay units with switches and terminals available for delay changes. Up to 11 delay units can be housed. Cards for mounting units in rack are purchased separately. Note hinged front panel.

This rack mountable series of video and pulse delay lines has the capability of replacing up to 1450 feet of cable.



Showing 8 individual slide switches for rapid delay changes.

Four variable slide switch units are being offered with total delays of 255, 637.5, 1275 and 2270 nanoseconds. Each unit contains 8 individual delay units. **Four strappable units** are also manufactured with total delays of 317.5, 635, 1270 and 2260 nanoseconds. The strappable units consist of 7 separate delay lines each having their own input and output terminals. The slide switches or terminal strapping provide methods for adding the individual lines together so that the output is always the summation of the individual lines. This eliminates most video distortions and assures good chrominance to luminance delay. Precision delay changes of as small as one nanosecond are easily accomplished. Low insertion loss, amplitude and delay flatness, along with excellent pulse fidelity, are characteristic of this series.



Units are rack mounted by attaching a durable plastic card to the large surface.

All units are manufactured to fit standard 19 inch racks and are provided with additional inserts to satisfy almost any mounting requirement. Delay units and racks can be purchased separately. The rack is manufactured with a hinged panel so that fast delay adjustments can be made. However, once adjustments are made, the front panel prevents further tampering with the slide switches or terminals.

Models VP0635, VP1270 and VP2075 are padded to provide a flat loss at any setting. As a result of this padding, these units will exhibit a maximum variation of ±.2db at any delay setting.

Model VP0010 was designed specifically to be used as a delay trimmer in conjunction with our other delay units or any 75 ohm system. It offers .5 nanosecond switching resolution with excellent amplitude flatness up to 5.5 MHz.

These new delay units feature extremely flat amplitude response to 5.5 MHz, small increments of delay variation, low signal distortion and tight delay tolerance. The delay networks are ideal for pulse applications because of their fast rise times and low distortion. Amplitude equalization is employed to achieve excellent flatness over the video frequency range. The delayed output of any model in this group is the summation of individual lines. It is not the result of a tapped line. This feature insures that output pulse distortions are minimized. Units will match to any 75 ohm system and can be directly connected into the video signal path by means of BNC connectors.

"LC DIP" THE WORLD'S SMALLEST DUAL-IN-LINE 14 PIN TAPPED LUMPED CONSTANT DELAY LINE

The "LC DIP" represents the smallest delay line currently available. It is a lumped constant delay line offering the ultimate in high density packaging and tapping capabilities.

These units are excellent for high frequency applications. The availability of 10 equal delay increments and the dual-in-line packaging along with its low silhouette make for compatibility with semiconductor and other assemblies where circuit board height must be held to a minimum. The foregoing makes the "LC DIP" extremely adaptable for the computer and allied industries.

ATTN. COMMUNICATION FIELD: VARIABLE DELAY for RADIO PAGING

In recent years, the communication industries have directed a good deal of attention to the development of devices suitable for delay correction of signals sent to remote transmitters. Paging systems use this form of delay correction and are one of the popular fields to employ these delay units.

SERIES "HF", "HR" & "VHR" LUMPED CONSTANT DELAY LINES

HIGHEST $\frac{\text{TIME DELAY}}{\text{RISE TIME}}$ RATIO EVER BUILT!

These Delay Lines have the highest ratio of time delay to rise time that has ever been built in a Lumped Constant Line. Unlike other types of high ratio lines, the Lumped Constant Delay Line has a passband from D.C. to its cutoff frequency and maintains a constant delay over these frequencies. These lines are also unique in that they offer relatively low insertion loss. The units are characterized by tight time delay tolerances, low pulse distortion, excellent phase linearity and good temperature stability.

To calculate rise time in microseconds, divide the ratio into the delay. To calculate bandwidth, divide rise time in microseconds into .36. Answer will be in MHz. Attenuation range 9 to 20db.

series 0447 DIGITAL

14 PIN - 5 TAP

TECHNICAL INFORMATION

Bel Fuse Digital Delay Lines Series 0447 features five equally tapped delay lines with total delays of 25 to 500 nanoseconds. The lines are compatible with TTL and DTL circuits. Either Logic "1" or Logic "0" inputs are accepted. Cascading of units causes no undesirable reflections. The reduced dimensions, with standard Dip Pin-Out permits dense packaging on your circuit board.
Special designs upon request.

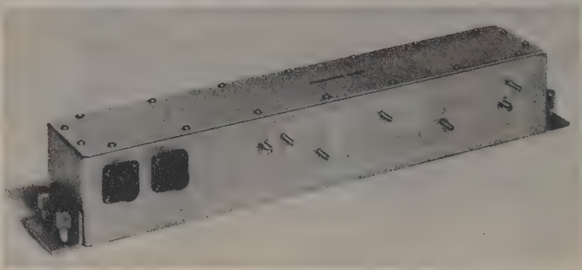
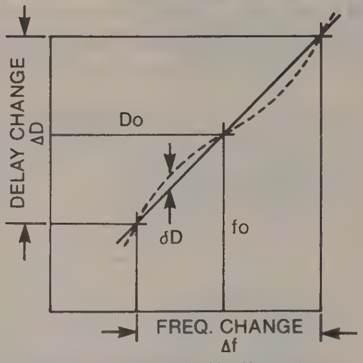
DISPERSIVE DELAY LINES



SERIES DDL Delay varies with frequency. Prime application is in Pulse Compression Radar Systems to eliminate large, expensive filter components. Compression Ratios to 240:1. Units are lightweight, and offer increased radar range and better radar resolution at lower peak power than available without dispersive lines. Units can be housed in hermetically sealed oven assemblies, providing extremely stable performance over the full MIL environment.



Definition of Dispersive Delay Line Nomenclature

DELAY DISPERSION shows delay change versus frequency relationships for the ideal delay line with typical deviations from the ideal condition. The graph is helpful in analyzing the delay line specifications shown in the chart. Each column of specifications is for a specific delay line built & tested. Below are some definitions of terms used:

$\Delta D \bullet \Delta f$ = COMPRESSION RATIO OR DISPERSION FACTOR
$\frac{\Delta f}{fo}$ = BANDWIDTH %
fo = MIDBAND FREQUENCY
Do = MIDBAND DELAY

Part Number	Compression Ratio	Bandwidth MHz	Delay Change μsec	Midband Frequency MHz	Bandwidth %	Midband Delay μsec	Spurious Signals dB	Delay Linearity %	Insertion Loss dB	VSWR

GET ORGANIZED!

Are your catalog files organized? Can you find any given catalog in a matter of seconds? If your answer is "Yes," you probably already have the EEM File System. But, if you said "No," you really ought to look into this simple system. It will save hours of time and tons of aggravation.

The EEM File System was invented over twenty-five years ago to help people who specify, buy, or work with electronic products and equipment. It is upgraded on a constant basis to reflect the current state of the art. It's easy to use and easy to customize to your particular needs.

You say you want to file catalogs by type of product? That's easy to do with The System. But, what are you going to do when there are multiple products in one catalog? Take Mallory for example. There are all kinds of products in the Mallory Short Form Catalog. With the EEM File System all you do is file the catalog under "M" for Mallory and refer to it on all of the cross reference cards that apply.

There are thousands of EEM File Systems in everyday use in engineering and procurement offices all over the world. Shouldn't you be using this proven system?

The EEM File System is shipped in one neat package. The package contains everything you need to set up your very own filing system. Best of all, it's easy to get and very affordable. Send a check or money order for $25.00 and EEM will pay the postage and sales tax. If you must use a purchase order, please add $5.00 for postage and handling. An invoice will accompany your System.

Engineered Components Company is pleased to introduce several new product lines and expanded capability in active digital modules. The succeeding 15 pages contain abbreviated data sheets covering 29 product lines of both passive-analog and active-digital delay lines

In addition to the delay lines shown, pages **1A**•1500 through **1A**•1507 in this section provide data on the following additional active digital products utilizing LC delay line technology:

Noise Filter Modules
Pulse Generator Modules
Square Wave Generator Modules
Digital Clock Modules
Digital Frequency Multiplier Modules

These modules are designed specifically for mounting on printed circuit boards in system applications where critical timing functions are required. These products find wide industrial applications in microcomputer, computer interface, radar timing, communication, instrumentation, dynamic and static memory timing and high speed RAM, PROM and IC test equipment.

The following active delay line modules are covered in this listing:

Five (5) output Logic Delay Modules
Ten (10) output Logic Delay Modules
Fixed Logic Delay Lines
Multiple Logic Delay Lines
Programmable Logic Delay Lines

These products are offered in modules compatible with T^2L Schottky, T^2L low power Schottky, ECL 10,000 and ECL 100K logic families.

CONSTRUCTION: The active digital modules shown in the following pages are of hybrid construction utilizing the proven technologies of active integrated circuitry and of passive networks utilizing capacitive, inductive and resistive elements. All integrated circuits used in these modules are pre-packaged by the manufacturer and burned-in to Level B of MIL-STD-883 to ensure a high MTBF. The passive elements utilized in the construction have been selected to provide adequate derating to preclude premature failures, thus contributing additionally to a high MTBF. On the detailed product pages, you will find MTBFs that are obtained by calculations per MIL-HDBK-217B for a 50°C ground fixed environment. In the case of the T^2L modules, the operating temperature is 0° to +70°C, for ECL 10,000 it is −30° to +85°C and for ECL 100K it is 0° to +85°C.

PACKAGING: The modules shown in the following pages are packaged in dual-in-line configuration. All modules are epoxy encapsulated in housings molded of flame-proof Diallyl Phthalate. Leads meet the solderability requirements of MIL-STD-202, Method 208. Standoffs are provided, either on the leads or on the housing, to provide positive standoff of the modules from the printed circuit boards to permit solder-fillet formation and flush cleaning of solder-flux residues for improved reliability.

MARKING: Marking of all modules consists of manufacturer's name, logo (EC^2), part number, terminal identification and date code of manufacture. All marking is applied by silk screen process using white epoxy paint in accordance with MIL-STD-130, to meet the permanency of identification required by MIL-STD-202, Method 215.

EXTENDED TEMPERATURE RANGE: Many of the products shown in the following pages are also available as standard products in an extended temperature range of −55° to +125°C. These standard product lines are the TTLDL, TTLDM and the MTTLDL. Most products, however, can be supplied in the extended temperature range, based upon specific customer requirements, even though no standard product line exists.

SPECIALS: In addition to the items offered as standard products, we continually develop "made to order" parts where differences in tolerances, delays, silhouette, etc., are required. Engineered Components Company has the technical staff and capability, the modern equipment and extensive component inventory to support development and production of special variations of our standard product lines. Because of our experience and expertise in the unique products which we presently produce, in many instances we are able to develop entirely new special modules. Lead time for special versions is often only a matter of a few weeks and, in some cases, even days. We invite your inquiries.

Engineered Components Company is dedicated to customer service which includes on-time delivery, development of special products required to satisfy a particular need, customer satisfaction and a response to advanced state-of-the-art developments in active module products required by industry applications. We shall always strive to be progressive, innovative and responsible. Because of the extensive standard products available from our company, it is impossible to have all items in inventory at all times. We will make the commitment, however, to satisfy the customer's requirement for delivery and continually strive to "put out the fires" and to provide the product in sufficient numbers to prevent customer production problems whenever possible.

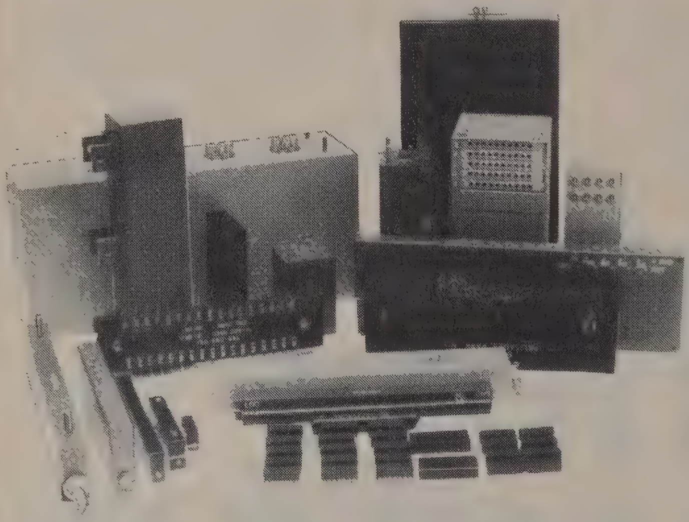
DELAY LINES

OVER 30 YEARS OF SUPERIOR QUALITY AND RELIABILITY!

30 years of experience and expertise in delay line design and manufacture. The following pages list a large sampling of the industry's current demand for short delay lines both analog and digital types, but ESC is still the most chosen source for delay lines ranging up to several hundred milliseconds and with delay-to-rise time ratios up to 250:1. In addition to lumped constant types, also manufactured are distributed constant, voltage variables and mechanically variable devices.



ESC ALSO DESIGNS AND MANUFACTURES TYPICALLY:

Equalized, Precision tapped, low distortion, beam forming delay lines for sonars, scanners, transponders, sorters, Tacan and DME, etc.

Programmable and mechanically variable Delay lines for the TV Broadcast industry, including video cable simulators and voltage variable Delay Lines.

Proven design, manufacturing capabilities, and facilities encompassing all quality levels dictated by MIL-I-45208 and MIL-Q-9858A.

HIGH RELIABILITY:

The proven design and manufacturing techniques are employed by ESC for all levels of reliability required for the military, satellite or space probes and encompass quality levels dictated by MIL-I-45208 & MIL-Q-9858A as applicable.

ESC has participated in many hi-rel programs over the years starting with Appolo, Minuteman and the Viking Probe and currently in such programs as Trident, F15, F16, B-1, Space Shuttle and Peacekeeper.

ESC maintains an extensive continuous program of life testing on the new generation of military TTL compatible hybrid delay lines. This program has accumulated in excess of 12.8 million unit hours of test, yielding a failure rate of .0234%/per 1000 hrs.

ESC has expanded its testing capabilities for the new generation of TTL, DTL & ECL Compatible hybrid delay lines. Testing is accomplished by computer controlled, state-of-the-art equipment, which is capable of recording leading and trailing edge delay time, rise and fall time, all within seconds. In addition and at comparable speeds, the hybrid delay line DC parameters such as Icc, Vi, Vol, Voh, Ii, Iil and Iin are swiftly measured and recorded if necessary.

The highly accurate and high speed testing system allows all parameters to be tested on a 100% basis guaranteeing the highest quality product to our customers.

At the side is a sample computer read-out exhibiting the leading and trailing delay and rise and fall times at three operating levels for a TTL hybrid delay line.

GET ORGANIZED!

Are your catalog files organized? Can you find any given catalog in a matter of seconds? If your answer is "Yes," you probably already have the EEM File System. But, if you said "No," you really ought to look into this simple system. It will save hours of time and tons of aggravation.

The EEM File System was invented over twenty-five years ago to help people who specify, buy, or work with electronic products and equipment. It is upgraded on a constant basis to reflect the current state of the art. It's easy to use and easy to customize to your particular needs.

You say you want to file catalogs by type of product? That's easy to do with The System. But, what are you going to do when there are multiple products in one catalog? Take Mallory for example. There are all kinds of products in the Mallory Short Form Catalog. With the EEM File System all you do is file the catalog under "M" for Mallory and refer to it on all of the cross reference cards that apply.

There are thousands of EEM File Systems in everyday use in engineering and procurement offices all over the world. Shouldn't you be using this proven system?

The EEM File System is shipped in one neat package. The package contains everything you need to set up your very own filing system. Best of all, it's easy to get and very affordable. Send a check or money order for $25.00 and EEM will pay the postage and sales tax. If you must use a purchase order, please add $5.00 for postage and handling. An invoice will accompany your System.

Don't waste any more time. Get organized now!

CUSTOM MINIATURE & PRECISION DELAY LINES...

Optimization of Most Critical Parameters as Required.

Over the past two decades, **Kappa** has optimized, packaged, and critically tested literally thousands of specific variations of several hundred different passive and hybrid delay lines: fixed tapped, continuously adjustable, and electrically trimmable (varactor-tuned) lines; over virtually the complete signal spectrum from control (subaudio), through audio, sonar, RF, HF, and a wide variety of pulse rates widths and duty cycles.

Typical design families include:

- PRECISION SONAR DELAY LINES (Series A) 500 μsec to 10^6 μsec ±1%; linear to ±0.05%
- LOW-DISTORTION LINES (Series D) Delay-to-Rise-time Ratio: 50 max.; Bandwidth: 50 MHz max.
- MINIATURE CONTINUOUSLY VARIABLE DELAY TRIMMERS (Series TT) Size: ¼ Cubic Inch; up to 120 ns; resolution ≤0.25 ns.
- SUPER-η™ DELAY LINES (Series H) Embody New Design Principle Providing the Highest Efficiency Yet Obtainable in Lumped-Constant Delay lines.
- MINITRIM DELAY LINE (Series MT) Resolution Less Than .5 ns and Delay Ranges Up to 300 ns.
- VIDEO BROADCASTING DELAY LINES (Series BC) Widely Used in the Most Demanding Color TV Applications in American and European Systems
- TRANSPONDER/TACAN/DME (Series C) Designed to Meet the Requirements of MIL-D-23859 and to Withstand the Most Rigorous Military Environments.

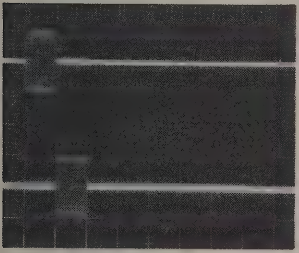
SAW Delay Lines

Surface Acoustic Wave Technology provides performance advantages and design flexibility that have proven to be invaluable to engineers in need of reliable, reproducible components featuring linear phase, temperature stability, small size, low shape factor and excellent rejection. Increasingly, SAW technology is meeting the exacting requirements of modern systems with high performance bandpass filters, resonator products, and other state-of-the-art signal processing components including dispersive, non-dispersive and tapped delay lines. In addition to this broad product line, Sawtek provides the total engineering support needed to make the proper design trade-offs among key parameters in order to achieve the optimum performance available from SAW technology.

Sawtek produces hundreds of standard SAW products for both low and high volume programs in Cable Television, Satellite Communications, Modems, Radar, EW, and many other signal processing applications. In addition, Sawtek's custom design capability can provide technical assistance and rapid response to new design and production requirements a frequencies from 10 MHz to more than 1 GHz. Sawtek also designs and produces custom subsystems which incorporate SAW components. These include filter banks composed of cascaded filters packaged in a single assembly, amplifier-filter modules with adjustable gain, and SAW resonator-controlled oscillators. Some of the common SAW delay line products produced by Sawtek and their characteristics are summarized below.

NON-DISPERSIVE

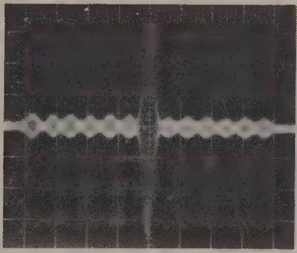
Sawtek produces non-dispersive delay lines for oscillator control, discriminator applications, and other signal processing delay requirements. SAW delay lines exhibit inherent bandpass characteristics and simultaneously provide selectivity in many cases. They are available with fractional bandwidths as large as 65% at frequencies up to 1000 MHz. The widest bandwidths require the use of lithium niobate materials with temperature coefficients of 72 to 94 PPM/°C. Quartz stability is offered for narrower band and frequency control applications with bandwidths from a few tenths percent to more than 5%. Delays from a few hundred nanoseconds to 40 microseconds are achievable. Insertion loss from 20 dB to 35 dB is typical to optimize group delay and time spurious performance. The photograph below shows a 400 MHz pulse input and subsequent output from a 2 microsecond, 250 MHz bandwidth delay line. Time spurious, including triple transit, is suppressed more than 40 dB. Low-loss versions can often be provided also.



TAPPED DELAY

SAW tapped delay lines are most frequently used to provide fixed-code generation or correlation for identification systems and spread spectrum communications. A familiar example of SAW devices of this type is demonstrated by a 13 bit Barker code at 60 MHz center frequency. The PSK code is generated by impulsing a complimentary SAW device and the subsequent matched filter output is shown below. Code lengths up to 127 bits are common. Fractional bandwidths are typically below 30% at center frequencies up to 500 MHz.

Tapped delay lines may also be used with external switches to provide variable delay or programmability. In this case, tap spacing is limited by rf feedthrough to delays larger than 100 nanoseconds. A more versatile approach to achieve programmable matched filtering is offered by SAW convolver technology. Some standard products are available and Sawtek offers rapid custom design for your specific applications.



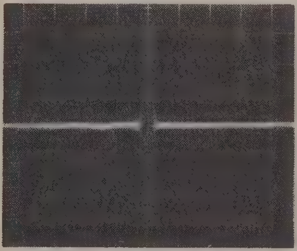
DISPERSIVE — LINEAR FM

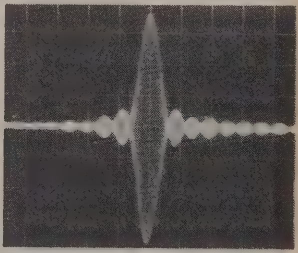
Sawtek supplies state-of-the-art linear FM delay lines for dispersive applications. Principal uses include pulse expansion and compression for radar, signal analysis for EW receivers, and transform processing for programmable filtering functions. Several different dispersive techniques are used to provide a wide parameter range: center frequencies from 10 MHz to 1 GHz, fractional bandwidths from 1% to 65%, and dispersive delays from 0.5 microsecond to 100 microseconds. Time-bandwidth products as large as 10,000 can be achieved although 50 to 2000 are more frequently used. Compressed pulse sidelobes vary from 13 dB nominally for unweighted frequency responses to 40 dB for some high performance weighted devices. A signal-to-noise ratio within 0.5 dB to 1.0 dB of theory is typical. Although all parameters cannot be optimized simultaneously, a thorough understanding of their interdependence permits maximum utilization of the advantages of SAW technology.

Conventional interdigital techniques easily achieve bandwidths up to 25% and time lengths as long as 20 usec. With quartz substrates for temperature stability, insertion loss of 40 dB to 50 dB is common for the wider fractional bandwidths. The compressed pulse shown on the left below has time sidelobes of 32 dB and is produced by a SAW expansion/compression pair at 30 MHz with 13 usec dispersive delay and 6 MHz bandwidth.

Dispersive delays up to 100 usec are implemented using Reflective Array Compressor (RAC) techniques. Compressed pulse performance is highlighted by time sidelobe suppression of 35 dB to 40 dB in most radar applications. These device types can be used to achieve very flat amplitude and accurate group delay response for EW receiver applications. This characteristic is demonstrated by the sin x/x compressed pulse at the lower right produced by a 40 microsecond RAC delay line.

RAC devices are usually supplied in an oven to minimize temperature effects on performance. In addition to ovenized assemblies, Sawtek also designs and manufactures custom subsystems employing SAW dispersive components.





Sawtek maintains a leadership role in SAW technology through the development and production of superior SAW components and a proven track record of delivering these reliable, high performance products on time and at a very competitive price in production quantities. Product reliability for Sawtek's broad range of military and commercial parts is insured by a watchful quality control program that meets even the exacting requirements of military and space applications.

When your system demands the advantages of SAW Technology. . . Demand Sawtek.

TTL DELAY MODULES

TTL Delay Modules are designed to be used directly with super high speed TTL, standard TTL, and DTL logic circuits. They provide many timing applications without any or with minimum interface.

TTL Delay Modules can be cascaded to get any combination of delay without degrading output rise time (T_R+ or T_R-). The delay to rise time ratio (T_D/T_R) of individual modules is very high (approximately 50:1) and improves with cascading modules.

Output rise times of each module are independent of input rise times up to 50 nsec. TTL Delay Modules are encapsulated by transfer molding. They are pin compatible with 74/54 Series TTL/SSI 14 Lead DIP Circuits.

NETWORKS

RANDOM NOISE MEASUREMENT NETWORKS (EIA STANDARD RS-250B)

Most of the video industry has found a need for passive networks designed for use in making noise measurements in a 75 ohm system. Allen Avionics now manufactures three passive networks for noise measurement. They include:

1) A Junction Filter to cut-off all frequencies below 10 KHz
2) A Lowpass Filter to cut-off all frequencies above 5 MHz
3) A Weighting Network to shape the passband

PRE-EMPHASIS & DE-EMPHASIS WAVE SHAPING NETWORKS

Pre-emphasis networks are used preceding the FM modulator in order to optimize the TV transmission.

De-emphasis follows the demodulator and serves to restore the wave shape of the demodulated signal.

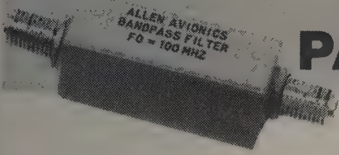
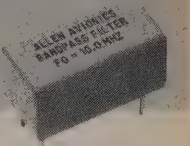
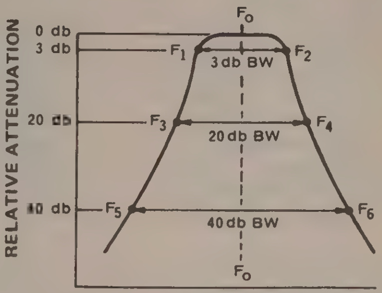
SUB-MINIATURE BANDPASS FILTERS
FROM 10MHz to 500MHz
PASSIVE L-C FILTER DESIGN





50 Ohms—1db Maximum Ripple

All of our filters are specified as having a minimum bandwidth at the −3db points and a maximum bandwidth at the −20 and −40db points. These filters are no exception. Most of the bandpass filters on this page do not exhibit arithmetic or geometric symmetry. However, to insure our customers of a simple method of determining their requirements, we are specifying the −3db, −20db and −40db bandwidths as if all had arithmetic symmetry. This will guarantee that at least ½ of the 3db passband will exist on each side of the center frequency. The −20db and −40db points will be no greater than ± ½ of their respective bandwidth away from the center frequency.



F_1 to F_o and F_o to F_2 > ½ 3db bandwidth
F_3 to F_o and F_o to F_4 < ½ 20db bandwidth
F_5 to F_o and F_o to F_6 < ½ 40db bandwidth

ORDERING PROCEDURE

	Can be any 3 digit number from 10 to 500MHz. "P" represents decimal point and must be used in 2nd, 3rd or 4th location.	Can be any 3 digit number up to 125MHz (a center frequency of 500MHz with a Q of 4). "P" represents decimal point & must be used in one of the 4 locations. The specified bandwidth must be within the limits of the tabulated Q. (See examples below.)		*P (for Printed Circuit Mtg.)

EXAMPLE: MB – 99P5 – 4P50 – A – S

This Part No. describes a bandpass filter having its center frequency at 99.5MHz and having a 3db bandwidth of 4.50MHz with an "A" shape factor and SMA Connectors. Note in tabulation below that for a center frequency of 100MHz, and a shape factor of "A", a Q of up to 30 is realizable.

EXAMPLE: MB – 10P0 – P200 – A – S

This Part No. describes a bandpass filter having its center frequency at 10.0MHz and having a 3db bandwidth of .200MHz with an "A" shape factor and SMA Connectors. Note in tabulation below that for a center frequency of 10MHz, and a shape factor of "A", a Q of 50 is realizable.

*PC Mounting optional for center frequencies of 100MHz or less.

DELAY EQUALIZED NTSC LOWPASS FILTERS — VFL, MVFL & VCL SERIES

For the video field, we have built many lowpass filters having sharp roll-offs and good passband delay linearity with cut-off frequencies from .1 MHz to 10 MHz. The most popular of these are used to attenuate the harmonics of the NTSC color sub-carrier frequency 3.58 MHz. The most commonly used filters in this group are tabulated below:

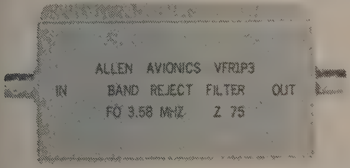
NTSC REJECT FILTERS

Some of the most frequent specifications that we encounter in the video industry are based upon rejection of the color information in the video signal to provide isolation from the luminance signal. These specifications require very low phase distortion to the luminance signal. To satisfy this requirement, Allen Avionics has designed a group of band reject filters with phase equalization where necessary. One of the most often used applications for this band reject filter is in color systems for monochrome transmission to prevent color flashes from appearing on the screen. Since various segments of the television industry have different passband requirements, we are listing three filters with different reject bandwidths.



Impedance = 75 ohms.
Maximum Insertion Loss @ 100 KHz = 3 db.
Maximum Passband Ripple to 5.5 MHz = ±.25 db.

NTSC BANDWIDTH FILTER

Allen Avionics sub-carrier bandpass filter is a low distortion unit designed to attenuate the luminance information in color TV signals. This filter is useful in most applications where it is required to isolate the chrominance information.

Impedance = 75 ohms.
Maximum Insertion Loss @ 3.58 MHz = 1.5 db.
Maximum Ripple = ±.25 db.

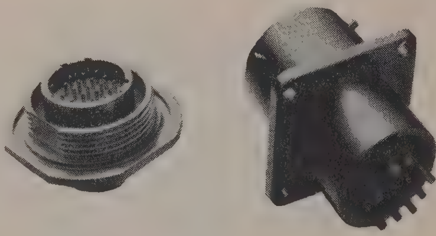
AMP Makes the Difference in Filters



All the above connectors are available in filtered version.

Proven, Inexpensive Filtering. AMP Quiet Line Filters provide proven, inexpensive filtering of conducted electro-magnetic interference (EMI) and general system noise. Available as loose pieces or as components of preassembled connectors, AMP Quiet Line Filters are divided into Standard and Premium groups. Standard series filters are appropriate for most commercial applications. Generally, Premium series filters offer higher operating voltage maximums, withstand higher operating temperatures and provide higher dielectric withstanding voltage and insulation resistance. Also, Premium series filters are subjected to environmental testing typical of components for military applications.

Standard and Premium filter groups are divided as follows: Within the Standard group there are three series having normal capacitance (20, 30 and 50 series having 1000, 2000 and 3000 picofarads min., respectively). Within the Premium group there are three series having normal capacitance (20P, 30P and 50P series having 1500, 3000 and 4000 picofarads min., respectively).

Standard mid-capacitance filters are divided into two series: The 90 series having 600 picofarads max. and the 100 series having 1000 picofarads max.

Standard low capacitance filters are divided into two series: The 60 series having 175 picofarads max., and 70 series having 400 picofarads max.

TECHNOLOGY "+" FILTERS

The Extra Edge in Systems Performance DC to 1 GHz

Comstron has developed optimum frequency or time domain filters to produce near theoretical system performance. These technology + filters are available as catalog items or custom tailored to your needs.

Design

Comstron has implemented modern network synthesis and physical realization techniques to the point where highly reliable, compact, LC and crystal filters are available – quickly and economically. Proprietary computer analysis, modeling, and optimization programs efficiently arrive at near-optium solutions to spectral, time domain, and stochastic problems. The Company's Enhanced Synthesis Program (ESP), Filter Optimization Program (FOP) and Parameter Optimization Program (POP) provide design parameters for systems oriented functions. Requirements for group delay equalization, wide band arithmetic symmetry, x/sin x amplitude correction, corrected Nyquist filters, phase compensation, and time domain response designs are routinely and efficiently handled.

Test

The Company's commitment to excellence is evident in its extensive test facilities. Automatic computer based network analyzers cover the frequency range from dc to 1.3 GHz with full plotting and printer output capability. Parameters which are automatically measured include amplitude response, phase response, group delay, and return loss. Time domain testing can also be performed to verify impulse response or response to complex waveforms.

Computer directed environmental testing allows unattended measurements of performance over temperature on a production basis. Comstron's proprietary Automatic Filter Test (AFT) programs permits rapid and accurate generation of acceptance test procedures as well as full documentation and data files when required.

Quality Control

Comstron maintains a Quality Control Department that ensures compliance with MIL-I-45208A and MIL-Q-9858A when applicable. Microscopic inspection, controlled environment, material control and traceability, solder training programs, and strict configuration management all contribute to producing an exceptionally reliable product.

The quality control program is continuously monitored. Over the years since its inception, Comstron has assembled a dedicated, conscientious staff whose pride of workmanship and customer loyalty is the keynote of the Company.

Miniature High Performance LC Filters 1-1000 MHz

Comstron's FA 3800 Series Miniature High Performance Filters are optimized for use in the 1 to 1000 MHz frequency range. Although they are considerably smaller than comparable tubular filters their performance is vastly superior. These filters are particulary suited to applications which require carefully controlled passband and stopband response as well as small size. These attributes are achieved through synthesis procedures and component topology unavailable for tubular designs. Models available with either SMA or BNC connectors for direct tubular replacement or maximum ground pin design permitting printed circuit board mounting for manufacturing convience and cost savings.

Main Features of Delta EMI Filters

DELTA EMI filters are designed and built in full conformance with UL Standard 1283, CSA Standard C22.2 No. 0.8 and VDE 0565 parts 1, 2 and 3. All EMI filters are UL recognized (ЯU), most have CSA (Ⓒ) approval, and VDE approval is in process for the entire line. Latest agency approvals are detailed in our complete catalog, available upon request.

All filters are built with a specially designed core cover that automatically maintains sufficient creepage distance between compensation choke windings. All terminals have an anti-rotation feature and are designed to maintain sufficient creepage distance between terminal and ground.

All electrical connections are soldered and mechanically secured. Every filter must pass 100% hipot, leakage current and insertion loss tests before shipment.

Custom Designs

Contained herein is Delta's complete line of standard filters. If our standard products cannot solve your particular EMI problems, our engineers will work with you to design and fabricate custom filters that are tailored to your specific requirements.

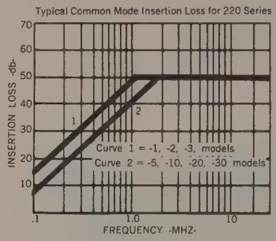
JMK INCORPORATED filters

JMK has the filter just right for your power application. Whether it has to do with audio systems, lab test equipment, medical equipment, printers, power converters, video displays, modems, processors, cash registers, pinball machines, televisions, aircraft power supplies, or whatever your specific application may be, we have the filter.

220 Series

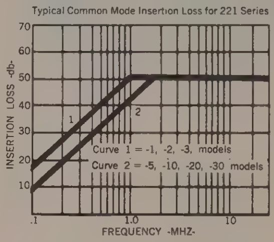
The 220 series is designed to give excellent filtering of "common mode," line-to-ground interference on computer-peripheral and other electronic hardware. Line-to-ground interference is the most common interference experienced and is generally the major source of "interference caused" malfunctions.



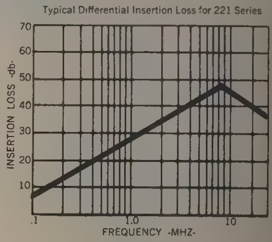
Typical Common Mode Insertion Loss for 220 Series

221 Series

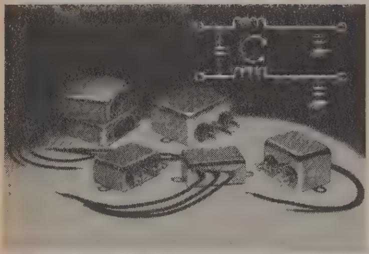
The 221 series has the same "common mode" performance as the 220 series but the circuit has been modified to give substantial "differential mode" rejection of noise caused by switching transistors and power supply diodes.



Typical Common Mode Insertion Loss for 221 Series

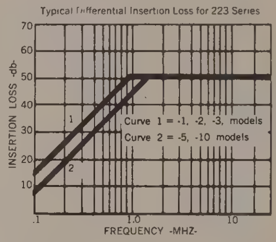


Typical Differential Insertion Loss for 221 Series

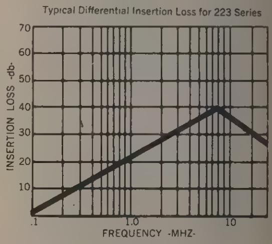


223 Series

The 223 series in intended as an economical compromise between the 220 and 221 series. This filter has the same "common mode" performance as the 220 model with approximately one-half the differential attenuation of the 221 series.



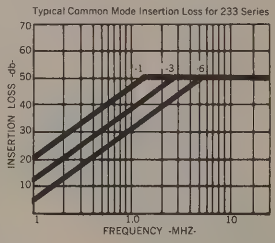
Typical Differential Insertion Loss for 223 Series



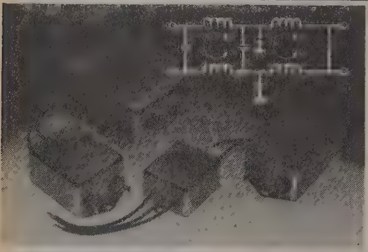
Typical Differential Insertion Loss for 223 Series

233 Series

The 233 series filter is a compact filter with an integral IEC connector. This filter gives effective line-to-ground insertion loss and has low leakage current to meet VDE, SEV and other safety organization requirements. If you want an integral filter and connector ask your representative or contact the factory. Many of our other filters can be made available with the IEC connector.



Typical Common Mode Insertion Loss for 233 Series



237 Series

This series is a high performance package where filtering requirements are more stringent than those associated with the 220 or 221 series. This package incorporates very high attenuation of both "common mode" and "differential mode" interference yet the cost for such attenuation is moderate.

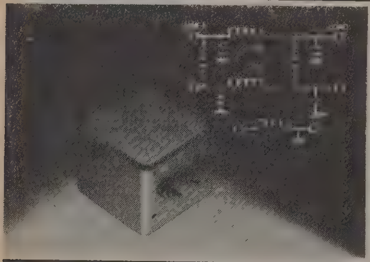
Typical Differential Insertion Loss for 237 Series



283 Series

The 283 series is a compact single phase high current filter. This filter is rated for 20 and 30 amps and has good common mode and differential mode insertion loss. This filter has a ground coil for high frequency ground isolation which may be included or omitted as desired.

Computer-Assisted Design

Shown here are some typical examples of our LC filter design capabilities. Through the use of in-house computers, plus computer time-sharing, we can quickly generate and evaluate such output data as frequency vs. impedance, attenuation, phase, group delay and phase delay in order to provide an immediate quotation.

KR Electronics has computer programs for:

1. Analysis of network behavior to determine attenuation, phase, group delay, transient response and response to a step function and a tone burst.
2. Predistortion of a network and synthesis of a network directly from the poles and zeros.
3. Designing equal ripple group delay networks from your error curve.
4. Determining a network's tolerance sensitivity and reliability.
5. Determining degree of success that can be achieved in production of matched networks.

Some of the specialized test equipment used:

1. Computer controlled HP 3042A automatic test set can supply tabular or graphic data with each unit.
2. Programmable synthesizer, phase, gain test sets.
3. Swept low frequency group delay and attenuation test set.
4. Spectrum analyzer.
5. Swept high frequency test set.

This INTERNATIONAL Power Module combines in one package four basic primary circuit components:

- rocker power switch (push button switch is available as an option)
- fuseholder that accepts either a 5 × 20 mm or ¼ × 1¼ inch fuse
- IEC-320/CEE-22 primary circuit connector
- high performance single-stage RFI power filter

The entire power module is designed from the beginning to satisfy the test requirements of UL, CSA, VDE & SEV. Use of this component can simplify the foreign approval process because it will eliminate the delays and extra costs associated with having unrecognized components tested or in sourcing approved primary circuit components.

The filter itself is designed to provide high attenuation in the range under 500 kHz. This makes it especially effective for use with switching power supplies. Its low leakage allows its use in portable equipment in accordance with VDE and SEV requirements.

The 8843.N3.9005.E international power module combines in one package four basic primary power components:

- Rocker power switch (the power module is available without this rocker power switch as a special option)
- fuseholder that accepts only a 5 x 20 mm international fuse
- IEC 320/CEE-22 primary power connector
- high-performance, 2-stage RFI power filter

This power module is designed to satisfy the test requirements of UL, CSA, VDE, SEMKO and SEV.

The filter itself is designed to provide especially high levels of insertion loss in the range from 100 kHz to 1 MHz and is therefore especially attractive for use with switching power supplies which draw 3 amps or less at 250 VAC and 4 amps or less at 120 VAC.

L/C filters are specified in either the Frequency or the Time Domain. Frequency Domain filters emphasize pass-band ripple and stop-band attenuation. Butterworth, Chebyshev, and Elliptic Function filters are included in this category. Time Domain filters emphasize the time-amplitude domain characterized by phase linearity and constant group delay. Bessel, Gaussian and other linear phase designs are included in this category.

Low-pass, Hi-pass, Band-pass, and Band-reject designs are available in the frequency range up to 800 MHz. Special Low-pass and Band-pass filters have been achieved featuring notches placed at desired frequencies in the stop-band to further attenuate undesired or spurious signals.

For those filter applications where size and weight are the prime consideration, PICONICS offers a line of chip inductor-capacitor designs. Low-pass, High-pass, and Band-pass types mounted on alumina substrates are available. Common substrate sizes are 1 × 1 inch and 2 × 1 inch. Overall package height is determined by orientation and size of the chip inductors.

To meet environmental military applications, filter networks are packaged in metal shielded cases with r.f. connectors. Printed circuit and end terminals are also available. Epoxy encapsulation is optional. For units assembled with chip inductors and capacitors on alumina/ceramic substrates, shield covers are optional. This is usually determined by the environment surrounding the device.

A Filter For Every Need

All Precision Filter systems use the same high-performance filters.

For the frequency domain, there is a Cauer (elliptic) high-pass or low-pass filter with 0.1 dB peak-to-peak passband ripple and 80 dB stop-band attenuation. Compare its attenuation slope of 80dB/octave with an 8 pole Butterworth's 48 dB/octave.

For the time domain, there is the TD1, a 6 pole, 6 zero equi-ripple delay (linear phase) filter, which has less attenuation in the passband and more attenuation in the stop-band than an 8 pole Bessel. Yet, it maintains a linear phase response within ± 2.5°. There is also the TD2 which offers both a 6 pole Bessel and a 6 pole, 6 zero time delay filter.

In any case, you get a tightly controlled elliptic or linear phase filter with phase match better than 1° and usually better than 1/2°

For bandpass operation, cascade a high-pass and low-pass filter to form a bandpass filter with 80 dB attenuation an octave above and below the center frequency.

For band-reject operation, parallel the inputs of a high-pass and low-pass filter and add their outputs through 1 k resistors to form a band-reject filter.

For tough anti-alias applications, cascade two LP2 filters to provide 90 dB of attenuation at 1.56 times the cutoff frequency.

For lowest cost solutions, we provide the option of fixed frequency filters.

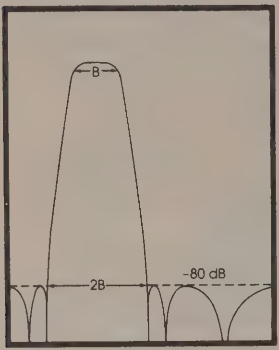
FREQUENCY-BAND TRANSLATORS



NEW SPECTRUM SLICER

Precision System 1776 is the industry's first multi-channel programmable frequency-band translator for signal conditioning.

It draws heavily on our advanced filter technology to provide usefulness not previously associated with frequency-band translators for applications like these:

- Super bandpass filter.
- Analog zoom for spectrum analysis, modal analysis and beam forming.

The Precision 1776 cuts far more sharply than any conventional bandpass filter can.

In fact, it's nearly perfect. The system translates band center frequency to zero, passing the signal band through sharp low-pass filters to obtain 80 dB/*bandwidth-octave* skirts. Q's can go higher than 10,000.

From there, the instrument can translate back to the starting band, acting as a super bandpass filter. Or it can translate to any other part of the spectrum.

Configured as a super bandpass filter, the Precision 1776 can have up to eight channels.

NEW SUPER ZOOMER

The Precision 1776 translator also can zoom in to make existing equipment do more work.

Ahead of an FFT spectrum analyzer, the analog zoom extends frequency range while making possible much finer resolution.

For modal analysis and beam forming, the 1776 discards unwanted noise and lowers the sampling frequency. As a result, old limits for computer speed, memory and AD conversion rates are overcome. Sampling rates can be decreased. Dynamic range and signal-to-noise ratio are enhanced.

For analog zoom, a 16 channel configuration is available for this Precision Conditioner.

Precision 1776 Features:

- Programmable center frequency: 3.2 Hz—200 kHz.
- Programmable bandwidth: 1 Hz—25 kHz.
- Phase match: 2° maximum, 1° typical.
- Wide dynamic range.
- Low noise: 250 microvolts in 20 MHz BW.
- Interfaces: serial, parallel, GPIB.
- $\frac{-80 \text{ dB bandwidth}}{-\ 3 \text{ dB bandwidth}} < 2$
- Passband ripple: 0.15 dB pk-pk.
- Outband rejection: 80 dB minimum.
- Hum: < – 100 dB, re full-scale.
- Noise: < – 100 dB, re full-scale.
- Intermodulation: < – 80 dB, re full-scale.

High Performance 1 & 2
Premium Performance 1 & 2

The High Performance General 1 Filters offer higher insertion losses for both line to line and line to ground emmissions.

The High Performance General 2 Filters are a dual T-section which provides small leakage currents at minimum costs without sacrificing high insertion loss capabilities. They are particularly suited for low impedance loads and insuring protection against pulse, continuous and or intermittent interference for protecting both equipment from the power line and the power line from the equipment.

The Premium Performance 1 Filters are designed to provide extremely high insertion losses for both line-to-ground and line-to-line emissions at frequencies ranging from .150 MHz to 30 MHz. They are particularly effective for equipment that must meet both stringent emissions and low leakage current requirements.

The Premium Performance 2 filters are particularly effective with systems utilizing switching power supplies and SCRs. The high insertion losses accomplished without any degradation of performance which could be caused by high peak currents which can be encountered in SCRs and switching power supplies.

These filters are designed and built to meet or exceed various safety agency standards and requirements and are U.L. recognized under File No. E83355 as part of the U.L. Component Program. They are also CSA certified. VDE pending, File No. 12509-4730.

Dual Mode Suppression 1, 2, 3 & 4

Medical 1

The Dual Mode Suppression Filters utilize the same effective general purpose designs for providing control of line-to-ground noise but with additional circuitry to reduce low frequency line-to-line noise and transient. This additional circuitry in the Dual Mode Suppression Filters is a line-to-line filter with high rejection at low frequencies for limiting the line to line noise.

These filters will protect equipment from malfunctions due to conducted interference coming into the equipment from the line. These filters will also provide the needed suppression to allow most equipment to meet FCC and VDE specifications for conducted emissions. Dual Mode Suppression Filters are available in our 1, 2, 3 and 4 configuration and are particularly effective when applied in equipment utilizing switching type power supplies and SCR components. **These filters are designed and built to meet or exceed various safety agency standards and requirements are U.L. recognized under File No. E83355 as part of U.L. Component Program and are also CSA certified. VDE pending, File No. 12509-4730.**

Medical 1 Series Underwriters Laboratory medical and dental equipment specification U.L. 544 is applicable to this series. AeroFilter medical filters meet the U.L. specification for patient care equipment of a maximum leakage current of 100 micro amps at 120 VAC, 60 Hz.

For non-patient equipment, where the maximum leakage current of 500 micro amps at 120 VAC, 60 Hz. is allowed, the General Purpose and High Performance General Purpose Filters have special versions with low leakage requirements to meet the U.L. non-patient equipment standard. The Aerovox Medical Filter 1 has two micro amps maximum leakage current used with hospital grade/low leakage line cord (6 micro amps maximum leakage current).

These filters are designed and built to meet or exceed various safety agency standards and requirements and are U.L. recognized under File No. E83355 as part of the U.L. Component Program. They are also CSA certified. VDE pending, File No. 12509-4730.

SAW Bandpass Filters

Surface Acoustic Wave Technology provides performance advantages and design flexibility that has proven to be invaluable to engineers in need of reliable, reproducible components featuring linear phase, temperature stability, small size, low shape factor and excellent rejection. Increasingly, SAW technology is meeting the exacting requirements of modern systems with high performance bandpass filters and other state-of-the-art signal processing components such as pulse compressors, delay lines, and resonator products. In addition to this broad product line, Sawtek provides the total engineering support needed to make the proper design trade-offs among key parameters in order to achieve the optimum performance available from SAW technology.

Sawtek produces hundreds of standard SAW products for both low and high volume programs in Cable Television, Satellite Communications, Modems, Radar, EW, and many other signal processing applications. In addition, Sawtek's custom design capability can provide technical assistance and rapid response to new design and production requirements at frequencies from 10 MHz to more than 1 GHz. Sawtek also designs and produces custom subsystems which incorporate SAW components. These include filter banks comprised of cascaded filters packaged in a single assembly, amplifier-filter modules with adjustable gain, and SAW resonator-controlled oscillators. Some of the common SAW bandpass filter products produced by Sawtek and their characteristics are summarized below.

WIDE BANDWIDTH

TVRO and other receiver applications often require wide bandwidth filters designed to provide superior rejection and group delay performance. SAW bidirectional bandpass filters are available with fractional bandwidths as large as 60% at frequencies approaching 1000 MHz. The high coupling materials used to achieve these bandwidths exhibit temperature coefficients of 72 to 94 PPM/°C. Insertion loss from 25 dB to 30 dB is typical of this class of filters in order to optimize group delay and time spurious performance. Shape factors (45 dB:1 dB) normally vary from 1.4:1 to 1.8:1.

Among a family of 70 MHz IF filters that is available off-the-shelf with bandwidths of 10 MHz to more than 36 MHz is the representative filter shown in the photograph below. This device provides a 24 MHz 3-dB bandwidth, 1.35:1 shape factor, and ±10 nsec maximum group delay variation. The packaged filter dimensions are either 0.87″×0.5″×0.2″ or 0.6″ diameter. Similar products are available at many other 1st or 2nd IF frequencies.

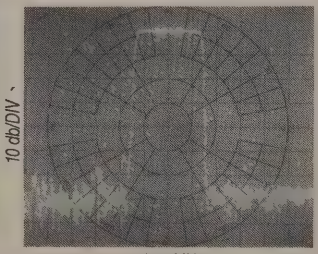
LOW SHAPE FACTOR

CATV modulator requirements and many similar applications require very low shape factor (45 dB:1 dB) to eliminate adjacent channel interference while preserving linear phase. Sawtek manufactures numerous VSB filters for both U.S. and European CATV requirements. This class of filters exhibits shape factors between 1.15:1 and 1.3:1 with an insertion loss of 20 dB to 30 dB depending on the bandwidth and center frequency. Such low shape factors are offered for fractional bandwidths from approximately 10% to 20%. These performance features are achieved in a 1.5″×1.0″×0.2″ dual in-line package and clearly demonstrate the size advantages of SAW technology.

A representative filter shown below delivers 5.5 MHz bandwidth at 43.75 MHz center frequency and a shape factor of 1.2:1 with ±1° phase linearity and greater than 60 dB rejection. Other products offered in this bandwidth range include Nyquist filters for CATV demodulators as well as various inexpensive components for modem, translator, and convertor applications with slightly higher shape factor requirements.



43.75 MHz
2 MHz/DIV

TEMPERATURE STABILITY

Quartz materials are frequently used in narrower band applications where increased stability is necessary. Filters with bandwidths from a few tenths percent to more than 5% are designed for quartz and exhibit total frequency shifts that are smaller than 50 PPM for a 0°C to 60°C commercial temperature range and nominally 200 PPM for most −55°C to +85°C military requirements. Shape factors from 1.5:1 to 3.6:1 are typical for these designs without sacrificing the high rejection expected of SAW devices. Insertion loss is normally 20-25 dB in order to maintain time spurious suppression of 45-50 dB. Bandwidths as large as 30% are implemented using quartz where higher insertion loss is tolerable and quartz performance is necessary. Both bandwidth and shape factor influence filter size, with larger sizes required for narrow bandwidths and low shape factors.

The performance shown below is a 60 MHz center frequency device with a 1.0 MHz bandwidth, 60 dB near-in rejection, and phase linearity of ±2°. The shape factor (55 dB:1 dB) is less than 1.8:1. Sawtek has many existing quartz filter designs at other IF frequencies.

0.5 MHz/DIV

LOW LOSS

Sawtek offers low-loss SAW filters with insertion loss from 4 dB to 10 dB. The achievable insertion loss depends on many interrelated factors including the substrate material chosen, fractional bandwidth, the Q of matching components, the center frequency, and other design and fabrication parameters. This class of filters can also achieve triple transit suppression of 45 to 55 dB without the added insertion loss required for bidirectional filters. Rejection is typically 40 dB to 50 dB with shape factors greater than 1.6:1. These capabilities enable low-loss SAW filters to be used for front-end filters and in other applications where noise figure or dynamic range are limited by filter insertion loss.

The filter example below achieves 5 dB insertion loss on quartz at 261 MHz with a 0.5 MHz bandwidth. Passband ripple is less than 0.04 dB and triple transit suppression exceeds 50 dB. Some standard products are available and Sawtek offers rapid custom design for those applications that require this technique.

SAW Resonator Products

Surface Acoustic Wave Technology provides performance advantages and design flexibility that has proven to be invaluable to engineers in need of reliable, reproducible components featuring linear phase, temperature stability, small size, low shape factor and excellent rejection. Increasingly, SAW technology is meeting the exacting requirements of modern systems with high performance resonators, resonator filters, oscillators, and other state-of-the-art signal processing components such as pulse compressors, delay lines, and bandpass filter products. In addition to this broad product line, Sawtek provides the total engineering support needed to make the proper design trade-offs among key parameters in order to achieve the optimum performance available from SAW technology.

Sawtek produces hundreds of standard SAW products for both low and high volume programs in Cable Television, Satellite Communications, Modems, Radar, EW, and many other signal processing applications. In addition, Sawtek's custom design capability can provide technical assistance and rapid response to new design and production requirements at frequencies from 10 MHz to more than 1 GHz. Sawtek also designs and produces custom subsystems which incorporate SAW components. These include filter banks comprised of cascaded filters packaged in a single assembly, amplifier-filter modules with adjustable gain, and SAW resonator-controlled oscillators. Some of the common SAW resonator products produced by Sawtek and their characteristics are summarized below.

SAW RESONATORS

Sawtek offers SAW resonators at fundamental frequencies from 100 MHz to more than 1000 MHz. These are high Q components which are primarily intended to be used in oscillators and are also used for both bandpass and notch filters. Sawtek resonators are inherently spur free in oscillator applications, exhibit low motional resistance, and have a pulling range comparable to a 3rd overtone bulk wave crystal. Typical values of R_S range from 15 Ω to 150 Ω and capacitance ratios are nominally 2000:1. Incorporation of special metalization improves oscillator noise performance by permitting drive levels up to +20 dBm. These quartz devices can achieve temperature stability of less than 50 PPM from 0°C to 60°C. Both one-port and two-port configurations are available.

Sawtek maintains a large inventory of pre-tooled SAW resonator crystals including many frequencies for CATV convertor applications. New designs can also be tooled rapidly to meet custom requirements. The 668 MHz resonator shown below is representative of Sawtek's low-cost standard products.

SAW OSCILLATORS

SAW resonator-controlled oscillators are currently produced by Sawtek for military and aerospace systems. Because they are able to operate at fundamentals of over 1000 MHz, SAW oscillators simplify design, reduce cost, and improve noise performance through the elimination of multiplier stages. In many applications it is also possible to achieve adequate power in one stage to directly drive a mixer and thereby eliminate the need for a buffer/amplifier stage.

Typical of the company's oscillator products is a fixed frequency, oven stabilized SAW resonator oscillator at 740 MHz. All spurious and harmonics are down 60 dB; the short-term stability is $\pm 2.5\times10^{-10}$ for 1.0 to 25 second averaging times and the phase noise is 120 dBc/Hz for a 2.5 kHz offset. The frequency versus temperature stability of this miniature ovenized unit is ±2 PPM from −15° to +60°C. A maximum power consumption of only 1.75 watts at −15°C ambient is achieved. Sawtek also offers assistance in oscillator design for low-cost consumer and commercial applications and is prepared to help evaluate the suitability of SAW oscillators for each new application.

SAW RESONATOR FILTERS

SAW resonator filters provide high rejection and low loss for narrowband applications requiring 0.01% to 0.25% fractional bandwidths. This family of Sawtek's resonator filters is characterized by a "new shape" in narrowband filter technology. The unique shape demonstrated in the performance photographs below arises from the combination of transversal filter and resonator characteristics: the narrowband response produced by the resonant cavity emerges from the broader passband of the input and output transducers.

Two pole versions typically exhibit from 2 dB to 5 dB insertion loss with 15 dB to 20 dB near-in rejection and 55 dB to 75 dB ultimate rejection. The two-pole 537 MHz resonator filter shown on the left below has a matched insertion loss of only 4.5 dB, 18 dB close-in rejection, and 60 dB ultimate rejection.

Rejection which is beyond the measurable range of most test instruments can be achieved by cascading these two-pole units into multipole configurations. Depending on the number of poles, this technique provides from 20 dB to 60 dB of near-in rejection, improved shape factor and reduced flyback. Insertion loss generally increases at a rate of less than 1 dB per pole for these filters. The six pole 149.3 MHz filter on the bottom right has an insertion loss of only 5.7 dB and an ultimate rejection of over 100 dB.

Sawtek's resonator filters are provided in individual two-pole stages in TO-8 and TO-5 packages and in custom modules when several of these 2 pole units are cascaded. Sawtek offers standard resonator filters and also rapid custom design.

HERMETICALLY SEALED EMI/RFI FILTERS AND CAPACITORS

These hermetic seal styles of filters and feed-thru capacitors are intended for bulkhead mounting to prevent spurious signals from entering or leaving a chassis, compartment or equipment. The discoidal ceramic capacitors used in Spectrum's filters "self resonate" at much higher frequencies than other types of capacitors (mylar and foil, tantalum, electrolytic paper, etc.).

Distributor stocked items are shown on page 3 of this catalog.

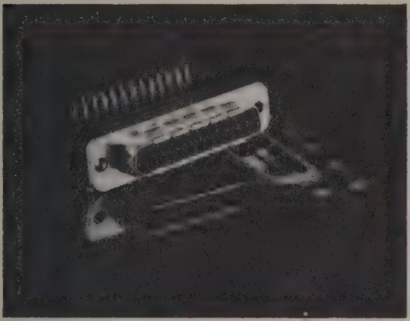
EMI FILTERED D SUBMINIATURE CONNECTORS



EMI FILTERED D SUBMINIATURE CONNECTORS

Spectrum D Subminiature filtered connectors feature a unique ground plane to effectively block bulkhead leakage of EMI. The design also provides line to line isolation to limit cross talk (line to line mutual coupling) to an absolute minimum. A most important feature is the coaxial spring contact that provides proper electrical grounding when mating one connector to another connector. Spectrum connectors are designed to provide compatibility with EIA RS-232 and RS-449 and will mount in existing chassis hole patterns.

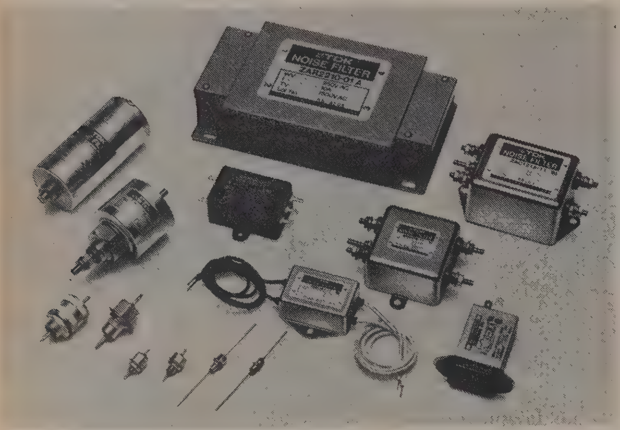
TDK

EMI FILTERS

EMI FILTERS



TDK manufactures an exceptionally broad line of EMI filters ranging from the miniature ZBF series to the sophisticated filter/power socket combinations. TDK's long experience in ferrite and SF cores as well as ceramic capacitors has resulted in EMI filters with superior performance. A condensed list appears below. For more details, ask for Catalogue BCE.

FEATURES

High permeability ferrite and/or high saturation SF cores are used as required for maximum performance and minimum size. High dielectric ceramic capacitors contribute to performance. A full series is available to meet any EMI filter need. Meet or exceed all FCC, UL, CSA, VDE & TUV requirements.

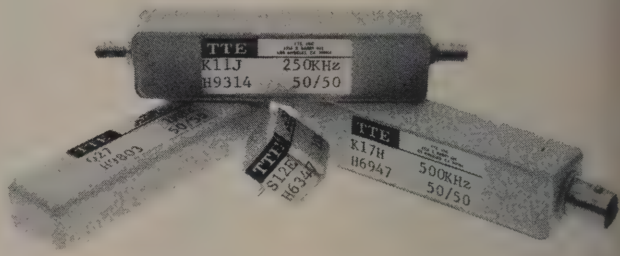
TTE® *miniature passive* FILTERS

T T E, Inc. is a California Corporation, established in 1954 and incorporated in 1957. Housed in its facility in West Los Angeles, are the sales offices, R & D department and manufacturing operation. Since its' beginnings T T E® has designed and manufactured both Active and Passive Filters.

When using this catalog, please remember the graphs are intended as a visual aid, not as a specification. The guaranteed specification is the specification listed in the individual product tables.

T T E® has no minimum order. There are no set-up charges for standard filter types and no engineering costs are charged to T T E® customers.

The first five pages of this listing are Passive Filters followed by the Active Filters, pages 7 through 9, the case and base dimensions for all types and the Passive Band Reject Filters are listed on page 10.



WIDE BAND FILTERS: A Bandwidth of ±20% or greater can be obtained by ordering T T E® standard Highpass and Lowpass filter sections as a composite network. Select the numbers from the Series H and J listing on pages 4-6 which give the desired attenuation slopes and combine these numbers. For example to obtain a slope of 40dB at 0.65 of the lower frequency, Fc1, (Highpass section) and 40dB at 1.6 of the upper frequency, Fc2, (Lowpass section) use Highpass series H69 plus Lowpass series J59. The resulting Bandpass number is K6959. THE HIGHPASS SERIES NUMBER IS FIRST FOLLOWED BY THE LOWPASS SERIES NUMBER. Types with dissymmetrical attenuation can be combined.

Insertion losses for bandpass types between equal terminations are from 0.5dB to 12dB depending upon the bandwidth, frequency and size. K10 and K11 types have about 10dB insertion loss and K12 types about 7dB flat loss. Specials are available for center frequencies from 10Hz upwards. Others are available with 60dB to 3dB bandwidth ratios of 2.0:1. Please contact us with your specification.

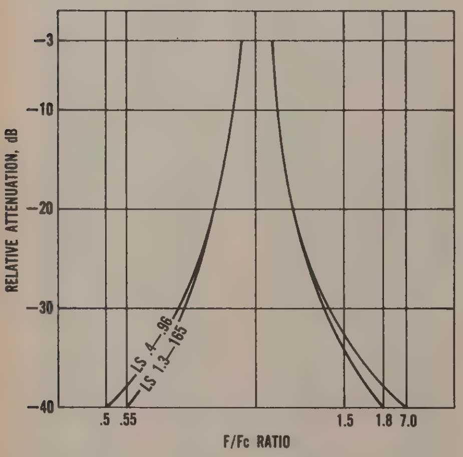
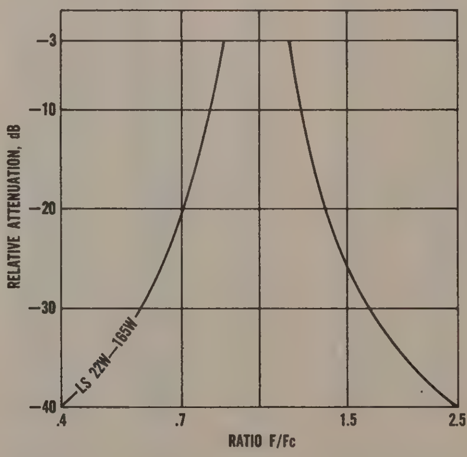
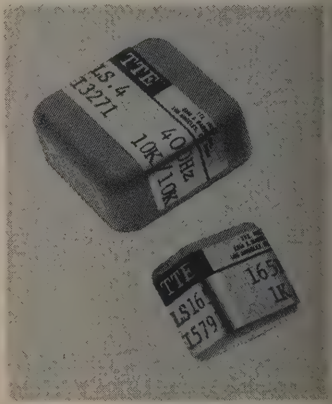
TO ORDER — specify the model number and channel needed. This series is a **STOCK ITEM**, however, the stock is limited to two of each frequency and are offered on a first come first served basis. There is a limit of two of each line item per customer if stock delivery is required. If T T E® is out of stock when your order is placed, T T E® will manufacture these networks and ship them to you within 7 working days; this service is provided at no additional charge. If you require sharper slopes the series Q bandpass filter may be specified. Shipment will be in accordance with the standard delivery schedule for that series. The series Q is available for IRIG channels in PCB cases even though PCB cases are not listed in the literature for that series. Please contact T T E® for exact dimensions.







Case and Mounting dimensions are listed on page 10.

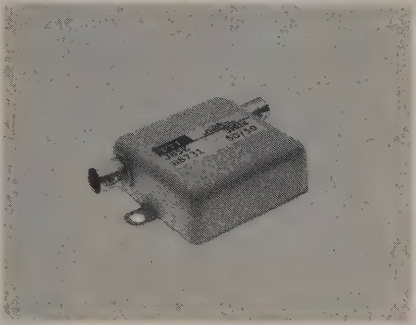
Case and Mounting dimensions are listed on page 10.



The Lowpass Filters cataloged on this page may be specified for any frequency from 10Hz to 20MHz. Frequency range and the case selections are listed to the right of each series.

The passband ripple is 0.4dB peak to valley for most types. Exceptions include series J91 through J97. Typical passband ripple for this series is 0.6dB peak to valley. If the small PCB cases are specified for low frequency networks the passband ripple may increase to 1dB peak to valley.

Phase linearity is reasonable, phase matched sets of filters may be specified. If phase shift is critical in your application T T E® also manufactures Bessel, Gaussian and Butterworth designs. Specify from 2 to 10 poles. The frequency range offered is from 1000Hz to 100KHz.

The maximum power measured at the filters' output terminal is 20 milliwatts. Exceptions are, the Subminiature series and again the low frequency filters and particularly miniaturized low frequency types. Please remember that T T E® also offers Active Filters that are substantially smaller at low frequency and less expensive; please see pages 7 through 9.

In the tables under the heading of chassis mounting cases are listed case 613, 718 and 720. These cases may be specified with either BNC or SMA connectors. Please note your choice when ordering by following the case number with B for BNC or A for SMA (i.e. 720A). The case dimensions and mounting information is listed on page 10. Please note that these networks should not be mounted near transformers or other strong magnetic fields.

To Order: specify (1) the T T E® series number and; (2) the cut-off frequency and (3) the source and load impedance (resistive), the impedance guide is below for your convenience. The approximate price range is $35 to $175 each in quantities of 1-24 units.

GAUSSIAN LOWPASS FILTERS are frequently specified by designers of pulse communication systems. This design features low ringing or overshoot. If the designer requires sharper cut-off ratios and can tolerate greater ringing or overshoot, the **BUTTERWORTH LOWPASS FILTER** should be considered. This design, like the Gaussian, features passbands and stopbands that contain no ripple.

TO ORDER: specify (1) the TTE® series number, (2) the cut-off frequency (Fc), (3) the source and load impedance (resistive) and (4) the case number. Prices range from $35.00 to $125.00 each in prototype quantities; there is a set-up charge for these series of lowpass filters.

Case and Mounting dimensions are listed on page 10.

The Highpass Filters cataloged on this page may be specified for any frequency from 75Hz to 20MHz. The frequency range and the case selections are listed to the right of each series.

The passband ripple is 0.4dB peak to valley for most types. Phase linearity is reasonable, phase matched sets are available.

The maximum power measured at the filters output terminal is 20 milliwatts for the series H and 10 milliwatts for the series S listed on page 5.

TO ORDER: specify (1) the TTE series number and; (2) the cut-off frequency and (3) the source and load impedance (resistive), the impedance guide is below for your convenience. The approximate price range is $35 to $125 each in quantities of 1-24 units.
